## Preface

Open, Distance, and Digital Education (ODDE) includes all kinds of teaching and learning processes in which educational technologies, digital media, and tools are used to present and deliver content, as well as facilitate and support communication, interaction, collaboration, assessment, and evaluation. With the global Covid-19 pandemic, ODDE has now entered the mainstream at all levels of education, and a renewed dialogue on ODDE has emerged, engaging many regions and countries. The Handbook of ODDE arrives at just the right time, intending to provide a comprehensive and updated overview of the field for educators, researchers, policymakers, and administrators in a wide range of sectors such as k-12 education, higher education, adult education, and workplace training. This Handbook has brought together leaders and scholars in the field of ODDE from around the world to discuss diverse perspectives and research findings on all important issues in ODDE.

In carrying out this exciting project, we have tried to make our Handbook more comprehensive, inclusive, and open by covering all important issues and themes in ODDE; encompassing the past, present, and future of ODDE; and developing it as an open-access publication for our global readership. We have also made our Handbook both theoretical and practical by discussing theories and models in ODDE at the same time as offering practical approaches and policies for the development and implementation of ODDE in various contexts based on research evidence. With our conscious effort to represent different parts of the world in author selection, we have invited authors from more than 20 countries across all regions (Africa, South and North America, Asia Pacific, Europe, and the Middle East). Most of our authors have experience in more than one national context. Moreover, we have included authors with different views and backgrounds to gain perspectives from both developed and developing countries on the macro, meso, and micro levels of ODDE research and practice. Finally, we have paid keen attention to the impact of the recent Covid-19 pandemic on ODDE research and practice and the opportunities and challenges of new and emerging technologies and methods, including artificial intelligence in education, learning analytics, and other digital transformations in the ODDE context.

We would like to express our gratitude to the six distinguished section editors – Professors Junhong Xiao, Svenja Bedenlier, Ross Paul, Tian Belawati, Vanessa Dennen, and Richard West – and to all our authors for their dedicated contributions

to the Handbook. Furthermore, we thank the Springer team, Melody Zhang, Mokshika Gaur, Jacob Arun Raj, and Alice Xie, for their support and help during this project.

We hope that this Handbook will inspire coming decades of ODDE theory, research, and practice and contribute to shaping the future of ODDE.

## About the Editors

### **Olaf Zawacki-Richter**

Center of Open Education Research  
Carl von Ossietzky University of Oldenburg  
Oldenburg, Niedersachsen, Germany

Olaf Zawacki-Richter is a professor of educational technology at the University of Oldenburg in Germany. He is the Dean of the Faculty of Education and Social Sciences and Director of the Center for Open Education Research (COER). Olaf has over 25 years of professional experience in the field of open, distance, and digital education. He has also served as a consultant and advisor, including work for the United Nations' International Labour Organization, the Office of Technology Assessment at the German Bundestag, and the German Science and Humanities Council (Wissenschaftsrat).

Dr. Zawacki-Richter has authored over 150 journal articles and edited several books, including *Online Distance Education – Towards a Research Agenda*, *Systematic Reviews in Educational Research*, *Open and Distance Education in Australia, Europe and the Americas: National Perspectives in a Digital Age* (Vol. 1), and *Open and Distance Education in Asia, Africa and the Middle East: National Perspectives in a Digital Age* (Vol. 2) – all published open access. He is an Associate Editor of *Distance Education* and the *Online Learning Journal* (OLJ) and a member of the editorial board of the *International Review of Research in Open and Distance Learning* (IRRODL), *Open Learning*, and the *Turkish Online Journal of Distance Education* (TOJDE).

His publications are available on ResearchGate and GoogleScholar.

**Insung Jung**

Education Research Institute  
Seoul National University  
Seoul, Republic of Korea

Insung Jung was formerly professor of Education at the International Christian University (ICU) in Japan. She is currently visiting research scholar at the Education Research Institute at the Seoul National University in South Korea. She has edited and authored several books with scholars from various parts of the world, including *Distance and Blended Learning in Asia*, *Quality, Quality Assurance and Accreditation in Distance Education and e-Learning: Models, Policies and Research*, *Quality Assurance in Distance Education and e-Learning: Challenges and Solutions from Asia*, *Online Learner Competencies: Knowledge, Skills and Attitudes for Successful Learning in Online and Blended Settings*, *Culture and Online Learning: Global Perspectives and Research*, *Liberal Arts Education and Colleges in East Asia: Possibilities and Challenges in the Global Age*, and *Open and Distance Education Theory Revisited: Implications for the Digital Era*. She has served as a consultant and advisor in ODE/e-learning to numerous national and international institutions, including the Korean Ministry of Education, UNESCO, the World Bank, and the APEC.

**Abstract**

This chapter provides a brief overview of the overall structure by the Chief Editors of the Handbook of Open, Distance, and Digital Education (ODDE) published in Springer's Major Reference Series. The handbook is organized along the lines of the 3M-Framework covering all important issues related to ODDE at the macro- (ODDE systems, theories, and methods), meso- (ODDE educational management and institutions), and micro- (teaching and learning) levels. Each level is addressed in one volume with two sections. Informed by the historical roots of ODDE, the editors and authors of this handbook are shaping the field of ODDE scholarship, theory, and practice.

**Introduction**

Planning for the publication of this *Handbook of Open, Distance, and Digital Education* (ODDE) began in the early months of 2020. Who would have predicted what has happened in the meantime due to the global Covid-19 pandemic? Suddenly and somewhat unexpectedly, online learning and teaching has now entered the mainstream of education at the same time as many educational institutions from K-12, higher education, professional and vocational training, and continuing education were forced into the digital world of online teaching and learning without being well prepared for it (Bozkurt & Sharma, 2020; Zawacki-Richter, 2021). In such "emergency remote teaching" (ERT, see Hodges et al., 2020) situations, teachers had often transferred what they knew from face-to-face teaching directly to the online environment as if there were no differences between them even though ERT had little in common with carefully designed ODDE.

However, ODDE is by no means a new phenomenon. It has evolved through several historical stages, from correspondence or distance education traced back to the nineteenth century with the introduction of the postal system to the use of print, radio, and TV, to the use of teleconferencing, computers, and multimedia, and up to the most recent development in online learning, including Massive Open Online Courses (MOOCs). Over the past decades, ODDE, especially online learning, has been seen as a main or alternative mode of delivery to widen access to education, provide flexibility and openness in school education, satisfy continuing educational needs of adults, expand the trained workforce, train teachers to improve the quality of schooling, and/or increase cross-border traffic in education. It has also been considered as an innovation to bring about pedagogical changes in various levels and sectors of education.

In a similar vein, digital education, an approach to the use of digital tools and technologies in the process of teaching and learning, has been introduced at all levels of education. Educational institutions now offer digital learning opportunities of

some kind that are flexible in terms of time and space to reach new target groups (e. g., international students or working adults) or to better serve the needs of their conventional student body in a blended or technology-enhanced format.

With the emergence of the Internet in the 1990s, online teaching and learning, as a form of open and distance education, became more widely accepted in education as Alan Tait, the former Pro-Vice-Chancellor (Academic) at the Open University UK, wrote around 23 years ago: “The secret garden of open and distance learning has become public, and many institutions are moving from single conventional mode activity to dual-mode activity, that is to say offering a range of modes of study from the full-/part-time and conventional/distance spectrum” (Tait, 1999, p. 141).

Moreover, since the beginning of the new Millennium, the range of international online degree programs has expanded greatly. An impressive example is Australia, where international online programs generate the highest export income in the service sector on the international, particularly Asian, market (Latchem, 2018). Despite concerns of education being treated as a commodity, open and distance education combined with digital education has contributed to the growth of borderless, transnational education.

As Jung (2019, p. 1) stated, ODDE is complex in nature and scope as it involves a wide range of nontraditional ways of teaching and learning that are mediated by various media and technologies. As ODDE developed, various theories and models have emerged to understand and explain its different aspects and practices, and many empirical studies have been conducted in a wide range of contexts (see Zawacki-Richter & Naidu, 2016; Zawacki-Richter & Latchem, 2018). Against this historical background, it is critical that we learn from the theory, research, and practice in open and distance learning to avoid reinventing the wheel for digital and online education.

We, therefore, hope that this Handbook of ODDE arrives at the right time. Considering changes of educational trajectories, it aims to provide a comprehensive and solid overview of the field for educators, researchers, policymakers, and administrators in such sectors as k-12 education, higher education, adult education, and workplace training. We hope that the handbook will offer a one-stop-shop for both early-career and established researchers, educators, policymakers, and administrators in the field of ODDE to gain a comprehensive overview of the history, theory, and practice at all levels of ODDE, and at the same time stimulate in-depth discussions on various themes and issues of ODDE for today and the future. We hope that, over time, the handbook will lead ODDE researchers to develop meaningful questions and undertake investigations to answer them, while at the same time informing practitioners and policymakers of best practices and future directions of ODDE. Researchers, scholars, and students in the field of ODDE can use this handbook as a major reference and source of inspiration in their research and course of study. Our ambition is to describe and define the structure of ODDE that will shape the *gestalt* of ODDE as an academic discipline and field of educational practice.

## ODDE Terminology

Remote learning, distance learning, open learning, e-learning, flexible learning, hybrid learning, blended learning, web-based learning, online learning, mobile learning, and technology-enhanced learning – these terminologies may be confusing for many readers. We decided to choose “Open, Distance, and Digital Education” as the title for this handbook, combining *open and distance education* to clearly mark the historical origin of recent online education, and *digital education* to capture newer manifestations of teaching and learning with digital media in the process of digital transformation of educational institutions.

We conceptualize ODDE as an overarching term to refer to all kinds of learning and teaching processes in which knowledge and skill base of educational technology, digital media, and tools are used to present and deliver content, as well as facilitate and support communication, interaction, collaboration, assessment, and evaluation. Thus, ODDE is not monolithic in form. It includes various practices, from technology-enhanced education, to flipped learning and blended learning to fully online education.

Closely related to ODDE is open education, a multifaceted construct with elements of openness to reach nontraditional groups of learners. It is manifested in open education practice and scholarship, Open Educational Resources (OER) and Massive Open Online Courses (MOOCs), and connected to the impact of technology in internationalization (see Zawacki-Richter et al., 2020, for a deconstruction of open education).

Another concept related to ODDE is distance education. In distance education, learners are separated from their teachers and the teaching institution. Hence, educational media are used to bridge the distance between the parties involved in the learning process (Keegan, 1980). The capability of media to afford two-way communication for interaction between learners and teachers and among learners is essential in this process. This is also reflected in the definition by Simonson et al. (2011): “Distance education is institution-based, formal education where the learning group is separated, and where interactive telecommunications systems are used to connect learners, resources, and instructors” (p. 126).

Open learning is often used as a synonym for distance education. However, Moore and Kearsley (1996, p. 2) argued that: “[. . .] the concept of open learning is different from distance education since it embraces the idea of students being able to take courses or programs without prerequisites and being able to choose to study any subject they wish. Indeed, most of the” Open Universities “were founded upon this basic premise. While some distance education programs may involve open learning, most do not.” Open learning, therefore, holds a philosophy of widening access to educational opportunities by minimizing academic and administrative restrictions.

With the emergence of networked, personal computers, and digital media and tools, the traditional boundaries between distance and conventional education have been fading since the end of the 1990s. Naidu (2003) observed that “The proliferation of information and communications technology (ICT) in conventional campus-

based educational settings is clearly blurring the traditional boundaries between distance education and campus-based face-to-face educational practices” (p. 350). Hence, terms such as blended learning (Osguthorpe & Graham, 2003), flexible learning (Collis & Moonen, 2001), or distributed learning (Lea & Nicoll, 2002) became prevalent at the beginning of the new Millennium. The experience and practice with online learning and teaching during the Covid-19 pandemic then gave rise to other terms such as remote and hybrid learning.

In the handbook, we have not attempted to use clear definitions of ODDE and other similar terminologies. Instead, we have encouraged the chapter authors to adopt their own approach to defining ODDE and related terms in a teaching and learning context of their interest. We believe that this flexibility will expand our understanding of the complex dimensions of ODDE and allow us to discuss diverse ways in which ODDE and other terminologies have been defined and used in research and practice.

---

## The Structure and Content of the Handbook

The chapters of this handbook provide a foundation for considering both accumulated knowledge and the future steps to understand and improve ODDE. To help readers understand the field of ODDE in a more systemic and comprehensive manner, we structure the handbook following the 3M framework proposed by Zawacki-Richter (2009) and Zawacki-Richter and Anderson (2014). The framework categorizes the major areas of theory, research, and practice along the lines of three broad perspectives, i.e., the macro, meso-, and micro levels:

- **Macrolevel:** ODDE systems and theories (the level of national, regional, and global systems)
- **Meso-level:** management, organization, and technology in ODDE (the level of educational institutions)
- **Microlevel:** teaching and learning in ODE (the level of individual learners and teachers)

Accordingly, the handbook is divided into three volumes with two sections in each volume. The six sections are edited by an international team of distinguished section editors with vast experience in ODDE as scholars and researchers, leaders, and administrators. Each section is introduced by the section editor with a chapter that provides an overview of major topics and developments in that area and how it relates to the broader field of ODDE. Based on the chapters in their respective sections, the section editors draw conclusions, discuss open questions, and elaborate on implications for theory, research, and practice.

Here is a brief overview of the content and major issues covered in the six sections of this handbook.

## **Macrolevel: Theories and Systems**

Each section begins with an Introduction chapter by the section editor. The chapters in Sections 1 and 2 examine theories and systems of ODDE from historical, cultural, and global perspectives.

### **Section 1: History, Theory, and Research in ODDE (Section Editor: Junhong Xiao)**

The first section lays the theoretical foundations of ODDE and provides an overview of the historical development, from correspondence education in the nineteenth century to current forms of digital education and technology-enhanced learning. Theoretical underpinnings which have changed over time are explored in the chapters dealing with the classical theories of the predigital era and new and emerging theories for digital learning spaces. The professionalization of ODDE as an academic discipline and field of practice has produced scholarly journals, professional networks, and associations, which are introduced in this section. Further chapters describe major research trends, methods, and digital tools for research into ODDE.

### **Section 2: Global Perspectives and Internationalization (Section Editor: Svenja Bedenlier)**

This section takes on a global perspective on national systems and networks in the context of the globally occurring digital transformation, resulting in the conceptualization of the different facets of internationalization in the context of ODDE. Digital education offers many opportunities for international learning experiences, physical but also virtual student mobility as well as program mobility. Chapters in this section tackle national and transnational policies for ODDE, international partnerships, and consortia as well as infrastructures and platforms for (open) educational resources. Special emphasis is placed on developing a critical reflection on the challenges and opportunities of ODDE in the Global South and the business of international education.

---

## **Meso-level: Institutional Perspectives, Management, and Organization**

Followed by an Introduction chapter written by each section editor, the chapters in Sections 3 and 4 examine issues in ODDE at institutional levels.

---

### **Section 3: Organization, Leadership, and Change (Section Editor: Ross Paul)**

This section discusses practices and changes in various types of ODDE institutions with a special focus on leadership, management strategies, and support systems. The chapters analyze the development and innovations in open universities, nonformal distance teaching institutions, and open and virtual schools around the globe. The various chapters explore how those ODE institutions have developed and managed strategic plans, change processes, and technology acceptance as well as examine various economic models of ODDE, effective leadership, and staff development practices in a wide range of institutional and sociocultural contexts.

### **Section 4: Infrastructure, Quality Assurance, and Support Systems (Section Editor: Tian Belawati)**

This section analyzes another important set of institutional issues including organizational and technology infrastructure, quality assurance and evaluation, accreditation, and support systems. The first chapters examine both common and unique models and features of organizational and technology infrastructure of various ODDE institutions. The next three chapters focus on ODE institutions' quality assurance, evaluation, and accreditation systems in relation to national and international frameworks. The last three chapters look into ODE institutions' support systems particularly for three categories of stakeholders: learners, faculty, and administrative staff.

---

## **Microlevel: Learning and Teaching**

Followed by an Introduction chapter in each section, the chapters in Sections 5 and 6 discuss issues related to open, distance, and digital teaching and learning, including learners, teachers, media and technologies, and instructional design, implementation, and assessment.

### **Section 5: Learners, Teachers, Media, and Technology (Section Editor: Vanessa Dennen)**

This section focuses on the profiles of students and teachers and on the media and technologies that are applied to facilitate teaching and learning in ODDE. In terms of students' characteristics, the chapters analyze issues related to their socioeconomic background, gender, and media usage behavior for learning. This leads to an overview of the various synchronous and asynchronous tools for interaction and collaboration, video-based approaches to teaching and

learning, as well as new and emerging applications of learning analytics, AI in education, and assistive technologies for learners with disabilities. Against the background of the various educational media and technologies, the remaining chapters deal with models and methods for their pedagogically meaningful application and the associated digital skills and literacy for teaching and learning in ODDE.

## **Section 6: Design, Delivery, and Assessment (Section Editor: Richard West)**

The final section starts with an overview of the various delivery modes of ODDE, which differ according to the degree of digitization and the degree of flexibility they allow. Special emphasis is placed on OER, MOOCs, and the development and delivery of online programs. The following chapters focus on the instructional design and pedagogical models and approaches to teaching and learning in digital environments to facilitate interaction, communication, collaboration, and assessment.

---

## **An Invitation to Knowledge Sharing and Future Research**

As the chapters of the handbook show, ODDE is becoming richer in theories and research, broader in practice and more influential at all levels and in all sectors of education. The discipline of ODDE has developed strong theories and advanced practice in a wide range of educational contexts, supported and informed by theories and concepts from multiple disciplines, including education, educational technology, media studies, computer science, learning science, and psychology. ODDE has combined many disciplinary approaches to the study of open and distance learning and digital learning. ODDE scholars who are chapter authors of the handbook conduct ODDE research in various academic fields and settings. They study ODDE from different perspectives and with different philosophies. The final result of their transdisciplinary endeavor is this handbook.

Thus, the handbook offers a transdisciplinary knowledge base in ODDE. The knowledge base offered here is what ODDE, as an academic and practical field, has learned about itself over time. It helps us identify and define problems in the field, and take certain positions or actions to solve those problems. At the same time, it influences, and is influenced by, advances in other fields and surroundings, and thus it is always growing and evolutionary in nature (Richey et al., 2010, p. 4). And eventually, this knowledge base in ODDE will help us create a coherent framework of ODDE to address unique problems involved in innovative and dynamic processes and products in open and distance learning, and technology-enhanced learning environments as Ren (2013, p. 10) similarly argued in the field of educational technology.

Given the urgent need for sharing knowledge and experiences in ODDE in light of the digital transformation and the current shift toward online teaching and learning, we are very proud that the handbook is published in an open access format and thus freely available to a global readership. We gratefully acknowledge the funding provided by the University of Oldenburg (Germany), Brigham Young University (USA), the International Christian University Tokyo (Japan), and the German Federal Ministry of Education and Research that made this open publication possible. It would have been an irony to publish a volume on ODDE in a closed, conventional format, hidden behind a paywall.

We believe that the notable strength of this handbook is in the diversity of perspectives presented by our international authors who have created a comprehensive knowledge base to examine the effects and issues of ODDE. With a broad range of authors and editors coming from over 20 different countries in all parts of the world, this handbook offers truly international perspectives on ODDE. It brings together diverse views from the authors who have been involved in ODDE in various settings at all levels of education. In this way, the international community of scholars contributing to this handbook is shaping the field of ODDE by building on its historical roots – distance education.

We hope that these diverse views engage our readers in scholarly discussions of ODDE, and expand their knowledge as they explore the many issues raised in this handbook.

Olaf Zawacki-Richter and Insung Jung

### Abstract

This introductory chapter explores the interrelationship and interplay between history, theory, and research in ODDE, demonstrating how they inform research and practice covered in the handbook. It is argued that lack of historical knowledge about ODDE, unawareness of ODDE theories, and negligence of the abundant research literature on ODDE have contributed to the marginalization of and prejudice against the field in the wider education eco-system, despite the fact that it has entered the “mainstream” of education now. Compelling arguments are advanced for the relevance of history, importance of theories, and necessity of research to the sustainable growth of ODDE. The chapter then goes on to explain the structure of the section, drawing the readers’ attention to issues worthy of further attention. It concludes with several implications from the other chapters in the section and a call for using them as a stepping stone to reimagining ODDE for the twenty-first century.

## Introduction

Open, distance, and digital education (ODDE) has entered the “mainstream” of education (Xiao, 2018) and even becomes “normalized” during the COVID-19 pandemic (Bond, 2020; Bond, Bedenlier, Marín, & Händel, 2021). However, it has yet to be heartily embraced as a “normal” form of education in the way campus-based education is referred to, by default, as education. The bias against ODDE exists, whether we like it or not.

For years, the prejudice against ODDE is also embodied in its ownership. Education, including ODDE provided by conventional higher education institutions (HEIs), especially elite universities, tends to be more favorably perceived simply as a result of their high reputation as an academic institution, while ODDE offered by dedicated ODDE institutions continues to be questioned one way or another. The logic behind this prejudice is that conventional HEIs are inherently superior to ODDE institutions and that elite universities are the best in all fields, including areas where they do not have expertise. In the eye of many colleagues from conventional HEIs, ODDE is massive open online courses (MOOCs), and vice versa because they turn a blind eye to what ODDE institutions and researchers have been doing in the past decades. Due to this negligence and unfair treatment, even MOOCs or ODDE programs offered by elite universities leave much to be desired, a tendency which contributes to further stigmatization of ODDE by dedicated institutions (Bozkurt et al., 2020).

ODDE is a branch of the wider education sector with a much shorter history. However marginalized and stigmatized, ODDE has survived for over one century either as an alternative to “normal” education or as a “normal” model of education for many people. It will continue to “disrupt” education even if its Cinderella status remains unchanged. On the other hand, the role of ODDE as a savior during the COVID-19 pandemic is widely recognized (Bond, 2020; Bond et al., 2021) and its presence in campus-based education will be as robust in the post-COVID era as in the COVID-19 days, if not more deeply rooted. It will be here to stay and its value is unquestionable.

Nevertheless, it should be borne in mind that the presence of ODDE in the ecology of education does not ensure the realization of its affordances and fair treatment. To what extent can ODDE give full play to its value? How will it evolve in response to emerging situations? Will it be referred to as education rather than be distinctively labeled, as is the case of campus-based education? The answers to these questions depend on how much it is historically rooted, theoretically underpinned, and research-informed.

---

## Relevance of ODDE History

Education is a social enterprise and does not exist in a vacuum. Learning from the history of ODDE enables us not only to avoid making the same mistakes occurring in the past (Moore, 2014) and/or new mistakes but also to revisit existing theories

and develop new theories when the situation so requires (Jung, 2019). Unfortunately, history is an under-researched topic in the literature of ODDE (Moore, 2008). Having paid heavy prices for this lesson, we have yet to learn from it and are continuing to repeat past mistakes and making new ones.

ODDE was an innovation in education in the first place. Each generation of ODDE emerged and evolved out of specific contextual considerations. For example, in addition to the availability of new and emerging media, which is often deemed to be an essential characteristic of each generation of ODDE (Garrison, 1985), what was its value proposition? What was its mission? Who were its target beneficiaries? What pedagogy was advocated? What (learning) culture was it situated in? What role was expected of the institutions, teachers, and learners, respectively? What social support (e.g., infrastructure, government policy, funding opportunity, and so on) was available? How open and resilient was the “mainstream” education system? Things like these interact with each other and help define ODDE in a specific period of history and in a specific context, which in turn helps shape specific ODDE theories. It goes without saying that ODDE practice and theories are not uniform across time and context. Historical knowledge of a specific model of ODDE or a specific ODDE theory is essential for it to be used in another historical period and/or in another context. Only with historical knowledge can we make necessary adaptation, adjustment, and refinement in our own practice. What has proved to be effective in the past and/or in a certain context may not be equally effective at present and/or in another context. Similarly, what proved to be ineffective in the past in a specific context may turn out to be adequate today and/or in another context. This is the contextualization-generalization-recontextualization cycle of ODDE theory building and application as proposed by Jung (2020). And as more and more changes have taken place, new theories may be in need, hence, for example, the emergence of connectivism, rhizomatic learning, and heutagogy for contemporary networked learning (Blaschke, Bozkurt, & Cormier, 2021).

On the other hand, it is worth emphasizing that there are elements that are applicable to all contexts and in different historical periods. In fact, the core of an ODDE model or theory tends to be “universally true.” Many lessons, both successes and failures, are relevant across time and context due to similarities in human learning patterns. For example, exclusive emphasis on learner-centered methods is doomed to be short of expectations despite the hype around this concept in recent decades. A typical case in point is the programmed learning advocated in the 1960s and 1970s which was designed to cater for learners’ varying needs and enable learning in flexible sequences and at varying paces (Kay, Dodd, & Sime, 1968). Programmed learning did not survive in the ecology of education because of its lack of direct human interaction which is essential to successful education. Even the radical newer theory of connectivism acknowledges the necessity of some form of mediation (Downes, 2022). Similarly, over-emphasis on teacher-centered or lecture methods has led to failure of many technology-assisted innovations, from the 1926 Pressey Teaching Machine to the later computer-based teaching such as Computer-Aided Instruction (CAI), Computer-Based Training (CBT), and Intelligent Tutoring Systems (ITS) (Harasim, 2015). MOOCs are another case in point. Ignoring lessons

learnt from decades of online education research, researchers are still looking for answers to questions, some of which were already answered by educational television researchers in the 1960s to the 1980s according to Baggaley (2017) who lamented the time and effort wasted by MOOC researchers in failing to learn from previous literature. For example, the failure of American radio and television in education was attributed mainly to the commercial broadcasters' attempt to prioritize advertising in their programs and teachers' unwillingness to adapt their pedagogy to take advantage of the technology. This remains one of the root causes of the failure to benefit from subsequent technologies today (Moore, 2014). Therefore, it is not surprising that "there has been a clear pattern of technologies that were going to change and save education but never did—over-promising and then under-delivering. The pattern goes back decades, and yet we continue to make the same mistakes" (Baggaley, 2014, p. 130).

Technologization of education, among other things, is a key factor contributing to the widespread disregard for ODDE history and its relevance to current research and practice in that "the mere thought of digital technology compels many people to look forward rather than back," an ahistorical approach – "anticipating what is about to happen with technology rather than attempting to make sense of what has already happened" (Selwyn, 2012, p. 216). A simplified view of education has prevailed in the education community in recent years, taking education for an issue of transmission of content, hence merely a technological issue (Harasim, 2015). MOOCs are the ultimate in this narrative. Located in the historical context of ODDE, MOOCs, especially the so-called xMOOC, are not a new concept at all (Bates, 2013; Romiszowski, 2013), not to mention small private online courses (SPOCs) championed by Harvard University (Coughlan, 2013). As pointed out by Daniel (2013), massive open courses have existed for over four decades. Both MOOCs and SPOCs are the norm of open universities around the world. So are flipped classroom and blended learning. For example, with an enrolment of around four million students at the Open University of China, it is not uncommon that certain courses are studied by tens of thousands or even hundreds of thousands of students at the same time. Yet, even such a respectable figure as Hunter Ripley Rawlings III, the President of the Association of American Universities, was surprisingly ignorant of the abundance of literature on online education contributed by the ODDE community in the past decades. He was quoted as saying "...there is very little good research on the best forms of online learning, and ... there are no good studies on what constitutes bad online pedagogy, of which there is a fair amount" (O'Neil, 2013).

---

## Importance of ODDE Theories

"There is nothing so practical as a good theory" (Lewin, 1952, p. 169). Unfortunately, theory is often associated with anything but practical and (even deliberately) neglected today. Theory is about how to "organize our knowledge... the reduction of our knowledge to the basic ideas, presented in a way that shows their underlying patterns and relationships" (Moore, 1991, p. 2). Good theories are applicable across

time although adaptation and extension and even new theory building may be necessary to respond to emerging circumstances. The practical value of theory is self-evident. Theory can inform practice, help us see where we are and what we need to do, and keep moving the field forward. Unless theoretically underpinned, practice cannot stand the test of time, even if it is seemingly effective at the moment, and neither can it feed and advance theory in return. Only when theory and practice are mutually informed can ODDE be quality-assured. It is absurd that the importance of theory to the development of ODDE needs to be discussed and reiterated among academics. Such discussion and reiteration is absolutely necessary today, though.

Despite “clear evidence of a strong theoretical underpinnings and considerations” in decades of ODDE research (Prinsloo, 2018, p. 8), the field has been under-theorized or a-theoretical in recent years, a concern supported by numerous large-scale systematic literature reviews (e.g., Bartolomé, Castañeda, & Adell, 2018; Bond, Zawacki-Richter, & Nichols, 2019; Hew, Lan, Tang, Jia, & Lo; 2019; Zawacki-Richter, Marín, Bond, & Gouverneur, 2019). This a-theoretical phenomenon is also echoed by responses from “research active” researchers in the field of educational technology and educational media (Bulfin, Henderson, & Johnson, 2013) and Prinsloo’s (2018) observation of the 2017 World Conference on Online Learning.

Are we entering a post-theory age? ODDE is not short of theories. There are classic theories and newer theories which are the results of dedicated research by the ODDE community ever since the beginning of ODDE practice. There are even theories and models of technology adoption and acceptance because ODDE has always been technology-mediated one way or another and to varying degrees throughout its history. The a-theoretical syndrome may be attributed to various factors. Disrespect for or unwillingness to learn from the ODDE history and its theories may be a major factor. Historically, academics treated ODDE with contempt, refusing to accept ODDE as part and parcel of the educational ecology and acknowledge its significant contributions to socio-economic development of the global community. The “deficiency” theory proposed by Hunter Ripley Rawlings, as mentioned above, exemplifies this mindset. Another major factor may be the popularity and hence predominance of Silicon Valley solutionism (Morozov, 2013), or the above-mentioned technologization of education, which, often accompanied by commercial motives, preaches the omnipotence of technology. According to this ethos, all educational problems are technological in nature and can be fixed by technology. Moreover, the more advanced a technology is, the more powerful and effective it is in enhancing learning outcomes. This groundless assumption is particularly prevalent today.

---

## **Necessity of Rigorous Research**

Is a pedagogical intervention effective? Can it deliver its intended objectives? Have its hypotheses been verified? How well does it align with a theory? How can it be improved? What lessons can be learnt from it? In what ways does it contribute to the

knowledge base of ODDE? How can it advance relevant ODDE theories? Such questions can only be answered through rigorous research. Nonetheless, it often happens that “the research we have is not the research we need,” as this title of a journal article suggests (Reeves & Lin, 2020). Take the affordances of technology, for example. They have yet to be tested by rigorous research despite all the hype. For example, a review of 252 studies on learning analytics in higher education (2012–2018) indicates a paucity of evidence for large-scale deployment (6%), learning outcome improvement (9%), ethical use (18%), and learning and teaching support (35%) (Viberg, Hatakkab, Bältera, & Mavroudia, 2018). In addition to theory exemplification and advancement, rigorous research and practice inform and enhance each other. However, only when research is rigorously designed will this interplay ensue.

Rigorous research should be intended to solve meaningful problems, underpinned by a theoretical framework, grounded in relevant literature, and designed to be fit for the research purpose with proper data collection instruments and data analysis procedures to ensure the validity and reliability of the results. Unfortunately, it is not uncommon that research in ODDE lacks methodological rigor (Bulfin, Henderson, Johnson, & Selwyn, 2014; Panda, 1992; Simonson, Schlosser, & Orellana, 2011), is under-theorized (Jones & Czerniewicz, 2011; Markauskaite & Reimann, 2014; Saba, 2000), and/or concerns “isolated studies focused on new things rather than significant problems” (Reeves & Lin, 2020, p. 1999; also see Bulfin et al., 2013). For example, according to a systematic mapping review of 282 primary empirical studies on emergency remote teaching by HEIs during the COVID-19 pandemic (Bond et al., 2021), only 10.6% were built on a theoretical framework, 2.5% were designed as (quasi-)experiments, and 55.7% did not indicate even the time of data collection while 92.9% were cross-sectional studies. It should be noted, though, that these studies were mostly hasty in nature in an attempt to respond to the rapidly worsening COVID-19 crisis. However, this does not justify their lack of rigor. Results and conclusions from research of this kind beg the question of whether they are trustworthy and generalizable. These findings are shocking because what used to be the problems in ODDE research remain unsolved today or have deteriorated. For example, the reviews of Berge and Mrozowski (2001) and Lee, Driscoll, and Nelson (2004) show 6% and 12% of their samples ( $n = 890$  and  $383$ , respectively) adopted an experimental method. However, only 2.5 are found to be (quasi-)experimental in Bond et al. (2021). This phenomenon echoes Baggaley’s (2017) argument that in online education, the problems of 10 years ago have grown worse today.

As an academic gatekeeper, I am fully aware of and deeply concerned about these counterproductive issues. The causes of this situation may be many and various. Still, I want to emphasize the imperative of fostering and enhancing research literacy among the academia. Only rigorous research can promote one’s professional development both in terms of mastery and advancement of theory and improvement of practice; only rigorous research can add to the knowledge base of a field or discipline and advance theoretical evolution. Oftentimes, in my capacities as a regular reviewer of major journals and conferences as well as journal and book editor, I have the

impression that many researchers are keen to take a shortcut to “success.” For example, instead of taking great but absolutely necessary pains to familiarize oneself with key theories and seminal works in a particular field of study and keep updated on new research outputs by regularly following publications through rigorous peer-reviewed venues, there is a tendency to make a last-minute effort to catch up on relevant knowledge, for example, by conveniently turning to blogs, un-vetted online publications and conference papers/presentations (Baggaley, 2014) for “theory” and “research findings,” quoting from sources with no expertise in ODDE such as *Harvard Business Review* and *MIT Review* or authoritative figures in fields other than ODDE (Prinsloo, 2018). These people seem to take it for granted that everything needed for research is just a click away from the Internet.

Some 35 years ago, the founding father of distance education, Charles A. Wedemeyer commented that “without it [research], we cannot pick up our field, raise its level, and improve its practicality” (Moore, 1986, p. 62). The importance of rigorous research cannot be over-emphasized.

---

## Structure of the Section

The section starts with Michael Grahame Moore’s account of key developments, trends, and players of ODDE in the past one-and-a-half century. Readers should be aware that Moore’s account is primarily situated in the United States of America and Great Britain. Following Moore’s chapter is Marco Kalz’s review of open education (OE) from the perspective of social movement theory and his argument for an alternative direction for the development of OE. Knowledge of the ODDE history may inform the interpretation of OE as a social movement. The point is to what extent and in what aspects OE is a social movement and can draw on the latter theory to promote future work. Instructional design and technology have gone hand in hand in ODDE ever since its initial days. Michael H. Molenda traces the origins and development of instructional technology and design. The history of this area is embedded in and shaped by the larger societal system and practice, a point to be borne in mind today. Given that education is increasingly digitalized, Martin Weller’s chapter explores the way in which digital education overlaps with OE and illustrates this intersection with five popular educational technologies. Readers are advised to further explore the interplay between educational technologies and OE by transferring Weller’s arguments to other and/or emerging technologies. The history part of this section is wrapped up by Benedict du Boulay’s chapter on artificial intelligence (AI) in education and ethics (► [Chap. 7, “Artificial Intelligence in Education and Ethics”](#)). Readers are encouraged to explore the open questions raised in the chapter and in particular to tackle AI in ODDE by building on du Boulay’s brief account of implications for ODDE.

Since the 1960s, several ODDE theories have been well established in the field. Terry Evans and Viktor Jakupec analyze the contexts in which Otto Peters, Börje Holmberg, and Michael Grahame Moore built their theories and recent scholars validated, interpreted, and developed these theories. A key thread woven throughout

the chapter is the interplay between theory and (contextualized) practice. With increasing popularity of digital learning, new theories have been built. This is what the chapter by Stephen Downes is about (► [Chap. 9, “Newer Theories for Digital Learning Spaces”](#)). Anchored to the historical context of ODDE development, Jon Dron and Terry Anderson analyze three pedagogical paradigms – objectivist, subjectivist, and complexivist – in the field and discuss three emerging paradigms – theory-free, cultural, and theory-agnostic. This is evidence of how theory shapes and is shaped by evolutions in practice. Given that motivation is essential to the success of ODDE, a chapter is devoted to motivation theories in which Clarence Ng introduces key theoretical perspectives on motivation, namely sociocognitive theories, sociocultural theories, and the concept of perezhivanie and discusses how each of them can inform understanding of ODDE and its practice. Ng’s new insights into the interrelationship between motivation, empowerment, and ODDE can lead to new directions for research and practice. Like motivation theories, technology acceptance theories and models play an instrumental role in research and practice of ODDE. Andrina Granić gives a brief account of basic concepts and identifies major research themes and findings. Of particular value to readers may be the future research directions suggested.

The remaining two chapters focus on research trends in ODDE and research tools and methods. Olaf Zawacki-Richter and Aras Bozkurt use various bibliographic analyses to identify research trends. Their observation of the impact of COVID-19 on ODDE research and practice is worth further exploring. The last chapter by Heather Kanuka discusses research tools and methods from the perspectives of big science and little science (► [Chap. 14, “Big Science and Little Science in Open and Distance Digital Education”](#)). Given the emerging nature, these new tools and methods need to be validated, improved, or adapted through continuing empirical research.

---

## **Conclusions and Implications for Theory, Practice, and Research**

This section aims to expound on the relevance of history, the necessity of theory, and the imperative of research to ODDE researchers and practitioners. By providing comprehensive, up-to-date overviews of the topics involved, the authors also draw on their expertise as renowned experts in their respective area of research to suggest directions for further research and practice.

Several implications can be drawn from this section. First, ODDE has a rich history, the lessons learnt from which are valuable to policy-makers, researchers, practitioners, and administrators alike. An adequate knowledge of this history enables us not only to avoid making mistakes, both old and new, but also to put theory into better use and enhance practice more effectively. Second, ODDE has developed its own theories and borrowed theories from other disciplines. There will be new theories to cater for the changing landscape. A-theoretical research is not research at all and a-theoretical practice is at most a one-off attempt. Third, ODDE is contextualized in terms of theory, research, and practice as well as in historical sense.

When adopting a theory, drawing on previous research findings, and/or following proven practice, contextual factors need to be taken into account. This contextualized nature also requires continuous innovation in theory enhancement/building, research, and practice in order to keep moving the field forward. Finally, research needs to be rigorously designed and conducted to inform practice while practice needs to build on relevant research to inform research. In summary, any improvisation of ODDE is doomed to failure.

Now is the best of all time for ODDE. ODDE has an unshakeable presence in the so-called mainstream education ecosystem. Moreover, pedagogically, it fits in with an increasingly technology-enhanced/mediated reality better than the traditional face-to-face mode of education. That said, there are and will be new issues to be addressed. For example, ODDE involves far more stakeholders, including micro-, meso-, and macrolevel actors, than it used to; the context in which it is implemented is far more digitalized and “intelligent” than in the past; it targets a whole spectrum of learners from K-12 to higher education instead of only those “nontraditional” learners; ODDE skills are a must to all instructional staff; newer technologies may be developed and used in education; new research findings from other fields may contribute to a better understanding of ODDE; national education policies may change to stimulate the expansion of ODDE scale and reach. The list can go on and on. It is time to reimagine ODDE. Each aspect of ODDE needs rethinking and re-inquiring to see whether it remains adequate or how it can evolve and adapt to the dynamic new context. The chapters in this section can serve as the starting points for ODDE’s new journey in the twenty-first century.

## Abstract

This chapter is about the history of open, distance, and digital education, with the primary focus on its evolving in the USA and Great Britain. A selection of key developments, trends, and players of more than 150 years includes reference to the nineteenth century correspondence schools, the American Land Grant universities, the pedagogical revolution in Charles Wedemeyer’s Articulated Instructional Media project, and its influence on the teaching model developed in the UK’s Open University. Brief coverage is included of the history of educational radio and television, the early computer networks, and the virtual classrooms. Knowledge of past achievements and failures is essential when planning for the future, and so the chapter aims to encourage research into personalization of learning in the correspondence tradition, most importantly research into institutional change and the reform of national systems.

**Introduction**

The history of open, distance, and digital education (ODDE) has been shaped by two complementary forces. One has been the ambition of a few educators in each generation to open opportunities for learning for anyone unable to attend a conventional school or university. Since this includes almost the whole adult population, distance education has featured largely in professional continuing education and other forms of lifelong learning. The other driving force in the history of distance education has been the use of communication technologies that bridge the distance between learners and educators.

Seen from this perspective, the modern field has evolved from a fusion of three traditions. These are the correspondence tradition of the nineteenth and early twentieth century, the “industrialized” tradition of the later twentieth century, and the digital virtual classroom of the twenty-first century.

---

**The Correspondence Tradition**

*The teacher-pupil relation in correspondence study becomes very real, very personal, and indeed very intimate, surpassing that which is possible in mass instruction. (Lighty, 1915)*

Correspondence education, in which learners and teachers communicated by printed and written text, has been the dominant form of ODDE throughout history. This section summarizes some of the history between 1840 and 1970.

Correspondence education began in the middle of the nineteenth century, when the new technology of the railway made it possible for documents to be distributed at low cost to any destination. The first to use the mail for teaching were Isaac Pitman in the United Kingdom (UK), Charles Toussaint in France, Gustav Langenscheidt in Germany, H. S. Hermod in Sweden, and Anna Eliot Ticknor in the United States of America (USA). Correspondence teaching was a revolution in education. For the first time in history, it became possible to learn from a teacher without leaving home or moving to “a seat of learning,” i.e., a university or school. It is doubtful if any other invention since the printing press has done more to open the benefits of learning to the majority of the population.

After nearly two centuries, correspondence courses have changed in many ways, but their fundamentals remain and are universal. The typical course is a series of lessons sent to each student by mail, with each lesson including an assignment to be completed by the student and returned by mail to the teaching institution, nowadays most likely by electronic mail or via the learning management system. The

assignment becomes the basis for a dialogue between instructor and student, which makes the lesson, in the words of William Lighty (above), “very real, very personal.” However, to create lessons that introduce many students to the same content in ways that also enable a high degree of individualization and person-to-person dialogue requires sophisticated instructional design capabilities. This is what differentiates the good correspondence course providers.

Most early correspondence courses were, as we would say today, “noncredit” continuing education courses, taken by young adults seeking advancement in trade and professions. The for-profit institutions that sprang up to provide such courses were “open,” to the extent that there were no entrance requirements other than the ability to pay a tuition fee. Examples in the UK include Skerry’s College (1878); Foulks Lynch (1884); University Correspondence College, Cambridge (1887); and the Diploma Correspondence College (1894).

Universities in the UK and in Europe were uninterested in correspondence education, with one exception. Beginning in 1858, the University of London – at that time an examining body, not a teaching institution – made its degrees available to anyone who passed its examinations, regardless of where and how they studied, including study by correspondence; from 1920 it provided its own correspondence courses, in commerce.

A different view prevailed in the USA. A law passed in 1862, the Land-Grant College Act, together with the 1887 Hatch Act, provided the foundation for a uniquely American university culture, more “open” than the European. In the words of Governor LaFollette of Wisconsin in 1900: “The state will not have discharged its duty to the University, nor the University fulfilled its mission to the people until adequate means have been furnished to every young man and woman to acquire an education at home in every department of learning” (Hansen, 1998, p. 29). The funding of what became known as Land-Grant universities depended on their progress in this democratizing mission, and for that reason correspondence education became a strategically important tool.

Correspondence teaching at the degree level was already established in several private colleges, most prominent being the University of Chicago, where “. . . even courses in science, usually taught in a laboratory were carried by the postman” (Storr, 1966, p. 201). By the year 1930, correspondence courses in 39 American universities enrolled “about two million students . . . four times the number of all the students enrolled in all the colleges, universities and professional schools” (Bittner & Mallory, 1933, p. 31). There was a boom also in courses taught by for-profit schools. Most famously, in Scranton, Pennsylvania, Thomas J. Foster established his Colliery Engineer School of Mines, renamed in 1891 the International Correspondence Schools (ICS), which by 1930 had four million enrollments. (ICS today practices under the name Penn Foster.) In 1902, ICS opened a school in the UK, which now operates as ICS Learn. Another boom – of fraudulent correspondence schools – led to the establishment in 1926 of the National Home Study Council (now the Distance Education and Training Council), set up to monitor the quality and business practices of for-profit schools.

Distance education was also used extensively in teaching children. As a forerunner of what is today called “blended learning” and was then called supervised

correspondence study “the local high school secures the lessons, provides periods in the regular school day for study, supervises the pupils’ work, and returns the lessons to the correspondence study center” (Broady, Platt, & Bell, 1931, p. 9). A conference on such supervised correspondence study held in Victoria, Canada, in 1938 was the founding of today’s International Council for Open and Distance Education (ICDE) (Bunker, 2003). The Proceedings of ICDE conferences from 1938 until the present are a valuable source of information about correspondence education around the world (<https://sites.psu.edu/acde/resources/international-museum-of-distance-education/>).

Elsewhere in the world, correspondence courses featured prominently in several English-speaking countries with rural populations dispersed over large regions.

In Canada, courses began at Queen’s University (1889), McGill University, and the universities of Saskatchewan (1912) and Alberta (1920). Their focus was the training of schoolteachers, while courses for children were run by the provincial departments of education. Eventually, correspondence courses were available from all ten provincial governments, thirteen universities, four institutes of technology, and from private schools. The prominent role played by government schools in Canadian correspondence education is revealed in a 1968 report, showing 87,692 students in schools run by the provincial governments compared to 16,048 in university courses (MacKenzie & Christensen, 1971, p. 281).

In Australia, the state of Victoria began courses for student teachers in 1910, the same year that courses in commercial subjects such as “health, meat or food inspectors or as local government clerks” began in New South Wales (ICCE, 1938, p. 26). The University of Queensland began its program in 1911. The Correspondence School at Blackfriars in Sydney was established in 1916, and by 1938 it had 6500 pupils and 150 teachers (ICCE, 1938, p. 20). In 1937, a Melbourne newspaper described “Victoria’s largest school” of 2,300 correspondence pupils who “learn their lessons in lighthouses and circus tents, in lonely farmhouses and in mission stations,” adding that “the teachers know each pupil more intimately than if he were one of a large class in a city school” (Preston & Campbell, 2019). In 1994 this school was renamed the Distance Education Centre of Victoria and in 2019 as the Virtual School of Victoria. From the 1930s, Australia’s state education departments used broadcast radio programs and two-way shortwave radios to supplement their correspondence teaching.

The New Zealand Correspondence School Te Kura was established in 1922 to provide lessons to primary school children. The enrolment in 1938 was 2750 (ICCE, 1938, p. 57). Each university had a small program, until 1960, when Massey University began a national program. The Technical Correspondence School was set up after World War II to provide resettlement training for military personnel returning from service and later became the Open Polytechnic of New Zealand. A film “A Letter to the Teacher” offers an entertaining demonstration of the merits of correspondence teaching for children (NZonscreen, 1957).

In the Republic of South Africa (RSA), the history of correspondence education is dominated by one institution. The University of South Africa (UNISA) began its correspondence courses in 1946. The most prominent of African students during the

years of apartheid were Nelson Mandela himself who obtained his BA degree and Robert Mugabe who earned a BA in Education. UNISA was always big. By 1970, six million parcels were mailed each year to 22,000 students taught by over 400 full-time academic staff (Diehl, 2011, p. 113). After its democratic system was set up in 1994, South Africa became one of the few countries to produce a national policy for open and distance education (SAIDE, 1995), assisted in the early years of its implementation by the World Bank's Telematics for African Development Consortium.

China's correspondence education began in the early 1900s when Yuanji Zhang, a publisher, established his Commercial Press Correspondence School (Jiang, 1954, p. 395, cited by Kang, 2010, p. 37). About the same time, America's International Correspondence Schools of Scranton established a branch in Shanghai (Jiang, 2008). The first university to offer correspondence courses was Renmin University of China, in 1953. A national program, with students in fourteen provinces, was started in 1958 by Beijing University of Posts and Telecommunications. By 1985, correspondence courses were offered by about one-third of all higher education institutions, with correspondence students making up one-third of total enrollment in higher education (Kang, 2010, p. 48).

In Sweden, Hermods Kerrespondensintitut, founded by H. D. Hermod in 1898, was the largest correspondence school in Europe in the 1960s enrolling 100,000 students a year. Hermods was Europe's pioneer of blended learning, which it called the "Robertsfors Method," with tutorial centers across Sweden to provide face-to-face support of the correspondence lessons. For much of its history Hermods' costs were borne by philanthropists, but in 1975 it became a for-profit company (Hermods, 2021).

In Russia, there were correspondence programs in the nineteenth century, but after the Soviet revolution, the method acquired strategic importance as a means of mass education and became integrated into the national educational system (Zawacki-Richter & Kourotchkina, 2012). In 1931 a special correspondence section was created in the Ministry of Education, and "correspondence institutes" were established in universities. By 1963 "The number of correspondence students . . . exceeded that of regular day enrollments . . . 1.3 million in regular day classes . . . 1.4 million in correspondence education." "In the postwar period the preparation of educational specialists in the sciences was carried out largely through the correspondence graduate work" (Mackenzie & Christensen, 1971, pp. 351–352). It was reported that British Prime Minister Harold Wilson's interest in distance education – which led to his championing the idea of an Open University – was influenced by his visits to Russia, where he learned that 60% of Russian engineers earned their degrees through correspondence and radio courses (MacArthur, 1974, cited in Diehl, 2011, p. 48).

---

### **Radio and Television: A Bridge Between Correspondence Study and the Open Universities**

Radio and television broadcasting helped to open educational opportunity in many countries but were most effective when married to correspondence teaching, most notably in the open universities of the 1970s.

The gold-standard for educational radio and television broadcasting was set in the 1970s by the UK's Open University (OUUK) (see more below) in its partnership with the British Broadcasting Corporation (BBC). The highest quality achieved in the USA was in the courses produced during the 1980s under the auspices of the Annenberg Foundation in partnership with the federal Corporation for Public Broadcasting (CPB). Some of these productions, such as "Destinos" and "Economics USA," may still be viewed online (Annenberg Learner, 2021).

Radio broadcasting in the USA fell short of expectations. Between 1910 and 1930, at least thirteen universities offered university credit for classes on radio, and yet by 1940 all had collapsed (Pittman, 1986). Among reasons for this failure was the unwillingness of academics to accept the technical direction needed to produce a quality program. Frequently, a broadcast was merely the live transmission of a lecture from a traditional classroom.

The situation with television was not much better. Although broadcasts from the universities began in the 1930s, they were little more than televised classroom presentations. In 1956 the Chicago City Colleges established a TV College, the first to offer a baccalaureate degree through a telecourse, but it was not until the 1980s that television became a serious teaching medium. Dissatisfied with what had been characterized as "dull grey professors reading their dull grey notes on dull grey screens" (Brock, 1987, p. 36), several community colleges banded together to share production costs and so produce courses that exploited the strengths of the television medium – location footage, a variety of expert opinion, movement, and drama. Among the most successful were the thirty-seven colleges of the Southern California Consortium, the Dallas County Community College District in Texas, and the University of Mid-America, a consortium of eleven institutions in seven Midwestern states. In 1981 the Adult Learning Service (ALS) was established. This was a partnership between colleges and universities, local and national non-commercial broadcasters, and was America's "first nationally coordinated initiative designed to make college credit courses and other formal learning opportunities available through television to adults" (Brock, 1987, p. 34). Over 1200 post-secondary institutions – one-third of all in the USA – participated in offering 200 college-level courses, including those of the Annenberg/CPB Project, delivered to 600,000 students.

In Great Britain, in contrast to the USA, universities had no more interest in educational broadcasting than in correspondence teaching. The national broadcaster, the BBC, began a Schools Radio service in 1928, and by the 1970s around 90% of schools tuned into its programs (BBC School Radio, 2011). Radio programs for adults were directed at listening groups set up by organizations like the Women's Institutes, the YMCA, and the public libraries (BBC Yearbook, 1939). Television programming ceased during the Second World War, so television for schools only started in 1957 (BBC, 2021).

In China, Tianjin Radio and Correspondence University was founded in 1958, Beijing Television College and Shenyang Television University (TVU) in 1960, and Guangzhou TVU in 1961.

Radio has been widely used in literacy and adult basic education projects. UNESCO reported programs in nineteen African countries, seven South American,

four Asian, three European, and five North American. Among many examples, in Congo Brazzaville, radio courses were followed by 53,147 persons, including those in “organized radio club groups” (Maddison, 1971, p. 6). In Mexico, programs were broadcast by 150 radio stations, and “about two million people are estimated to have derived real benefit from the courses” (Maddison, 1971, p. 10).

In the USA, a form of television that received much attention during the 1960s and 1970s was called Instructional Television Fixed Service (ITFS). This was a closed-circuit distribution system with a radius of about 25 miles (40 kms), used by school systems to share specialist teachers and cover low enrollment subjects.

## The “Industrialized” Tradition and Open Universities

*in traditional education, the teacher teaches; in distance education, the institution teaches.*  
(Keegan, 1980, p. 19)

This section describes two experiments that tested the concept of “articulating” technologies and specialists into a teaching system, thus contributing to the invention of open universities.

In writing about new perspectives on correspondence teaching, Wedemeyer and Childs (1961) devoted a chapter to the idea of linking technologies and people with different skills into a teaching system and quoted a speaker at the 1960 meeting of the National University Extension Association, R. C. Carpenter of the Pennsylvania State University, whose questions uncannily predicted the shape of distance education in the future open universities.

What would result if the activity of correspondence studies were staffed . . . and serviced by highly qualified faculty members fully assigned and dedicated to correspondence work . . . if a concerted effort was made to design and produce the highest quality of course materials . . . if radio, television and practical audio-visual materials were used to compose a new platform . . . and utilize small student groups to reinforce learning? . . . If correspondence could be freed from restrictive academic machinery . . . and given a chance for full development? (Wedemeyer & Childs, 1961, p. 73)

Two experiments were of prime importance in testing this idea about linking technologies. They have been widely overlooked in official histories, although their results helped determine the eventual shape of the OUUK and thus of modern distance education.

In the UK itself, the key project was a course in economics, taught by the department of adult education at the University of Nottingham in 1964. It consisted of 13 lessons, each of which linked a television program, printed study guide, and access to a local tutor. Key players in the project were department director, Professor Harold Wiltshire and course writers John Bayliss and Walter James. Television programs were broadcast on a commercial television channel. Assignments were mailed to the university and returned after evaluation and comment (Wiltshire & Bayliss, 1966).

In the USA, also in 1964, another project was underway, at the University of Wisconsin. The Articulated Instructional Media Project (AIM) offered courses in a variety of subjects, using correspondence and broadcast technologies, but also a wider range of technologies, such as audio tapes, home experiment kits, and mobile laboratories. However, the historical importance of AIM is not its technologies but its invention of a new way of organizing teaching. This was based on the idea that as well as linking (i.e., “articulating”) a variety of technologies – it was also necessary to link the knowledge and skills of a variety of experts. Thus, AIM tested the idea of deconstructing the teaching process into its many component skills and re-assembling them into a *system*. Courses were first designed and then taught, not by individual teachers but by teams of specialists. Course design teams included specialists in instructional design and in each technology, together with content experts and specialists in learning and learner support – who later became known as tutors (Wedemeyer & Najem, 1969). Viewed from the perspective of the teacher-centered, “sage on the stage” tradition of higher education, this was revolutionary, demonstrating that “in traditional education, the teacher teaches; in distance education, the institution teaches” (Keegan, 1980, p.19).

In 1965 the creator and director of AIM, Charles Wedemeyer, arrived in England to meet with Nottingham’s Wiltshire, Bayliss and James, and to these and others, he pointed out what he considered to be three flaws in his own project and the lessons to be learned. AIM, he said:

had no control over its faculty, and hence its curriculum: it lacked control over its funds; and it had no control over academic rewards (credits, degrees) for its students. The implications were clear: a largescale, non-experimental institution of the AIM type would have to start with complete autonomy and control. (Wedemeyer, 1982, p. 23)

In September 1967, the Planning Committee of the OUUK began its work, with Wiltshire as a prominent member. In 1969 the university’s first Vice-Chancellor Walter Perry invited Wedemeyer back to England to join him in planning the new distance teaching university. A unique and historically invaluable film of conversation between Wedemeyer, Perry, and James is available at [International Museum of Distance Education & Technology | American Center for the Study of Distance Education \(distanceeducationmuseum.com\)](https://www.distanceeducationmuseum.com).

Other institutions that featured prominently as models during that planning included the University of South Africa (UNISA), the UK’s National Extension College, and the University of New South Wales at Armidale, Australia (Sherow & Wedemeyer, 1990).

More than any other institution, the OUUK proved the viability of a systems model of distance education. What Nottingham and AIM demonstrated on a small scale, it demonstrated on a grand scale the effectiveness of pedagogical practices that were revolutionary in the freedoms they permitted the learner. These included not only access to instruction in places of the learner’s choosing but a previously unheard-of freedom to choose content and even to choose among alternative teaching methods. Such freedoms became possible in a program of many courses,

all structured in modules, in which the student can earn “credits” to accumulate toward a degree. The credit system that was an integral part of American higher education represented a massive reform in British practice. Not only could the student build a personal study package from the various courses offered but could also postpone study for a period, or even fail a course yet complete the degree – all eminently sensible options for adult, part-time learners, but foreign to the brutally competitive and selective higher education systems of Europe. Another American practice adopted (and spread) by the OUUK was that of “formative evaluation,” determining a student’s grade on a course by evaluating performance throughout the duration of the course, instead of evaluating solely on performance in a final examination.

Given the genesis of the OUUK in the idea of a University of the Air, it is noteworthy that the core teaching method was correspondence instruction – at first using traditional paper documents and later using digital technology. It should also be noted that since blended learning is such a popular concept today, face-to-face meetings between students and instructors at local study centers were designed into the budgets of every course.

With the success of the OUUK, many other countries followed in setting up similar national publicly funded, autonomous, distance teaching universities. They included: Spain (1972), Israel (1974), Germany (1974), Pakistan (1974), Canada – Alberta (1975), Costa Rica (1977), Venezuela (1977), Thailand, (1978), the Netherlands (1981), Sri Lanka (1981), Korea (1982), Turkey (1982), Japan (1983), Indonesia (1984), India (1985), Taiwan (1987), Jordan (1987), and Portugal (1988).

In China, the Radio and TV University (RTVU) was established by (then) Vice-Premier Xiaoping Deng, who is said to have been impressed by what he heard about the OUUK, described to him by former British Prime Minister Edward Heath (Wei, 2008, p. 45). The Central Radio and Television University (CRTVU) and 28 provincial RTVUs began teaching in 1979 with 115,200 students enrolled in diploma programs and 302,700 students in single courses (Yin, 1986).

Not all countries set up autonomous distance teaching universities, and in those that did not, distance education programs were embedded in their traditional institutions. Such programs could not enjoy the economies of scale that are essential to amortize the large investments needed to support high quality in designing and delivering technology-based programs. In some countries, institutions banded together to share their resources. Examples include: Federation Interuniversitaire de L’Enseignement a Distance in France, the Consorzio Per L’Universita a Distanza in Italy, and Contact North in Ontario, Canada. In Brazil, a unique consortia saw institutions from across the country contribute their specialists to virtual course teams assembled by the Ministry of Education to tackle a teacher education problem, the result being a high-quality distance education program that, in its first year, trained 27,000 rural school teachers (Moore, 2016).

In the USA, several consortia were set up, and most eventually broke up. One, a consortium of nine Midwestern universities called the University of Mid-America, put forward plans for an American Open University modelled on the British example, but their plans were thwarted (McNeil, 1993). Similarly, a proposed consortium

of providers to build an “Open School” in Wedemeyer’s own state of Wisconsin (Wedemeyer, Woods, & Moore, 1971) met political resistance and was stillborn.

Instead of building new systems, America experienced a frenzy of activity in satellite videoconferencing, more teaching by “dull gray professors reading their dull gray notes on dull grey screens.” Examples include the National University Teleconferencing Network, a network of 250 universities, colleges, vocational and technical schools, and the National Technological University which delivered courses from some 50 institutions to downlinks in 500 locations. Many business corporations used satellite delivered teleconference programs for staff training. For example, IBM’s Interactive Satellite Education Network had originating studios in four cities and receiving sites in twenty others. Teleconferencing was promoted for schools when a 1987 Act of Congress authorized \$100 million to support the so-called Star Schools network, which covered 3,000 schools in 45 states.

---

## **Digital Technology: From the Virtual Classroom Back to Independent Study**

With distance education embedded in conventional institutions, the concept of distance education as a personal tutorial was replaced by a focus on social interaction in virtual classrooms.

With the ubiquity of digital devices and the vast majority of educational institutions having some kind of embedded distance teaching program, distance education of a kind entered the educational mainstream. The role of the distance educator was no longer primarily that of a personal tutor but became one of managing learning as a social activity. Of course, these were not face-to-face groups, but “virtual groups,” of individuals in different locations connected through digital networks. Managing learning as a social activity meant that teachers could perform more as they did in a traditional classroom, and virtual classes could be administered much like traditional classes in institutions’ organizational structures. This trend gained momentum and foundational underpinning from the popular and widely disseminated theory of constructivism (Jung, 2019). Consequently, the virtual classroom became the dominant model of distance education in the twenty-first century.

The history of the virtual class can be traced back to the first computer-based educational networks in the early 1980s. These included BITNET (“Because It’s Time Network”), founded by the City University of New York (CUNY) and Yale University, the (US) National Science Foundation Network (NFSNET), Australia’s Academic and Research Network (AARNet), the UK’s Joint Academic Network (JANET), and the China Education and Research Network (CERNET). Although these networks were used more for research than for teaching, a trickle of research studies began to build awareness of their potential as a medium of distance education. Examples of such early reports are those by Hiltz and Turoff (1981) about students’ attitudes in the Electronic Information Exchange network and that of

Siegel et al. (1986) who described communication efficiency, user participation, and interpersonal behavior. The late 1980s also saw experiments at the Pennsylvania State University that explored the pedagogy of teaching in virtual groups, focusing on group dynamics, constructivist pedagogy, and what later became known as “social presence” (on this, see Garrison, Anderson, & Archer, 2003).

Following the invention of the World Wide Web, the Web browser Mosaic, high-speed networks, and handheld communications devices, the 1990s saw a scramble by universities and many school systems to set up their own web-based distance education programs. Some of these succeeded, such as Penn State’s World Campus (2000), Oregon State University (2000), and University of Florida (2001). Others failed. The UK E-University closed in 2004, University of Illinois’ Global Campus in 2009, and Columbia University’s Fathom Knowledge Network in 2012. In universities and school systems that did not set up a dedicated system, classroom teachers were simply told to go online and teach. The quality of most such programs was, inevitably, dismal. This was dramatically exposed during the Corona virus pandemic of 2020–2021 when teachers were ordered to teach homebound students in what was called “remote learning,” using live-streaming applications like Zoom and Skype. Faced by universal dissatisfaction with the results, politicians and administrators deflected attention from their failure to provide training and resources with promises of a swift return to the brick-and-mortar classroom. One invention that ameliorated the resulting chaos was the Learning Management System. For institutions that had established systems like Blackboard and WebCT, it was possible to not only distribute study materials but also give teachers support in basic instructional design, such as writing learning objectives, managing learner-learner interaction, and handling of assignments.

The end of the twentieth century saw the first steps in educational application of virtual reality. The Quantum Computer Service (later America Online) established a multiusers environment that allowed as many as 500 participants to interact through avatars – graphical representations of bodies and objects. Other early virtual learning environments included the Virtual Reality Multiuser Dungeon (VRMUD) and the Virtual European School Project (Bouras, Philopoulos, & Tsiatsos, 2001). Several desktop and web-based multiuser environments that “mimic a real university” are described by Monahan, McArdle, and Bertolotto (2008).

The first decade of the twenty-first century saw the universal take-up of what became known as Web 2.0, the social web. Using online platforms such as Facebook, Twitter, YouTube, Instagram, Snapchat, LinkedIn, and Pinterest, students could, in theory, participate in creating and distributing their own knowledge through such activities as blogging, tagging, and podcasting. The first decade of the twenty-first century also saw the invention of another form of web-based distance learning, Massive Online Open Courses (MOOCs). Beginning at the University of Manitoba in 2008, and boosted in the public eye by offerings from Stanford University and Massachusetts Institute of Technology, MOOCs soon became commercialized, leading companies being Udacity and Coursera. Udacity, by the end of 2012, had 370,000 students studying 18 different courses, while Coursera boasted 62 university partners

in 11 countries. Most MOOC courses were for technical and professional training and continuing education (Brown, 2013).

An intriguing development in the early years of the twenty-first century was a revived interest in independent study, now referred to as personalized learning, reflected in such documents as the Organisation for Economic Co-operation and Development (OECD) report on Personalization in the School System (OECD, 2006). Notable among the pedagogical tools that support such personalization of learning were techniques associated with learner analytics, adaptive learning, competency-based education, and assessment of prior learning. It appears that the same digital technologies that spurred the development of online courses that mimicked the classroom might also offer tools to facilitate the kind of individualized learning that characterized the oldest form of distance learning, namely, the correspondence course.

---

## A Note on History of Theory and Scholarship

The idea of distance education as a special field of study and research can be traced to G. B. Childs and Charles A. Wedemeyer (Diehl, 2019) in the USA and to Börje Holmberg and Otto Peters in Europe. Holmberg's (1960) treatise on teaching by correspondence was an early expression of a pedagogy of distance education, and his proposition that teaching by correspondence was a "guided didactic conversation" is widely cited as one of the founding theories. For his part, Peters published, as early as 1967 (in German), his theory of "industrialized education" (Peters, 2007). This theory, although independently arrived at, had much in common with Wedemeyer's theory of teaching as an articulated system. Wedemeyer also redefined correspondence education as "independent study," to show that learners are not only independent of teachers geographically but also, in those circumstances, may control much of their own learning (Wedemeyer, 1971). This idea of the learner's potential autonomy was taken up by M. G. Moore and linked to Peters' ideas about structure and Holmberg's concepts about dialog, in what became known as the theory of transactional distance (Moore, 1973, 2012). An exhaustive history of theory is found in Black (2004, 2019). Also refer to the chapter on theories in this handbook.

The history of distance education research and scholarship owes much to the research centers and scholarly journals that were established during the 1970s and 1980s. Research centers included: the Institute of Educational Technology (IET) at the OUUK; the DIFF at Tübingen, Germany; Central Institute for Distance Education Research (ZIFF) at the FernUniversität, Hagen, Germany; Centre for Distance Education (CDE) at Athabasca University, Canada; and the American Center for the Study of Distance Education (ACSDE) at the Pennsylvania State University, USA. The first scholarly journals, also established in the 1980s, were *Distance Education*, published by the Australian and South Pacific External Studies Association – the predecessor of the Open and Distance Learning Association of Australia, Inc. (ODLAA), the *Journal of Distance Education* by the

Canadian Association of Distance Education, the OUUK's *Open Learning*, and the *American Journal of Distance Education*, founded at the Pennsylvania State University.

---

## Conclusion: The New Must Be Informed by the Old – Lessons from History

If we, as distance educators today, are to have a rich knowledge base on which to construct, understand, and evaluate future choices, we must consider the important work done by distance educators from the last century. . . . As stated by Thomas Mann (1965), the best response to the question of what to do in situations presenting many new choices is to “assist the new without sacrificing the old.” (Bunker, 2003, p. 63)

The history of distance education provides many lessons to guide future practice and research. One is that, recognizing that every learner is different, educators must break free from the ancient preoccupation with the classroom and use well-tested instructional design and communication technologies to address that diversity. The lesson for researchers is that while continuing to inquire about the *social* dynamics of learning, more research is needed into the *personal* dynamics of learning, i.e., what goes on *inside* each student.

However, there is one lesson from history that stands out above all others. It is that only modest gains can be achieved by adopting new technology without changing teaching itself, from a single-person craft to a team process within a delivery system, and this requires broad and deep reform of educational institutions, especially their budgets and human resource management. Consequently, the most important historical research in the near future will be the study of institutional change, and the reform of national educational systems. In this, lessons may be learned from study of past successful innovations, and even more from the many failures. Why did the American Open University fail, and why was Wisconsin's Open School not implemented? What can be learned about successful national planning from Brazil's Proformacao teacher education project and South Africa's ODL policy, and why were these not sustained? Questions like these are questions about policy, leadership, and politics, and on the answers to these questions depends the future of distance education.

## Abstract

This chapter analyzes open education initiatives through the lens of social movement theory. Open education is introduced as a field with multiple dimensions, activities, and perspectives. Social movement theory is used to discuss along the dimensions of conflict and protest, cultural representation, values and collective action, and the influence of the social, political, and cultural context. Accordingly, epistemic communities are proposed as an alternative development direction for the field.

## Keywords

Open education · Open educational resources · MOOCs · Social movement theory · Epistemic community · Research

## Introduction

Open education has developed as an emerging field of research and practice in higher education. Building on the work of open and distance teaching universities, the field has launched several initiatives to open up higher education to learners outside of the educational institutions (Sabadie et al., 2014). The main patterns of work in the open education community in recent times have been related to open educational resources (OER) and massive open online courses (MOOCs). While the first theme focuses mainly on licensing questions of learning resources, the second theme concentrates mostly on open educational practices (OEP) in large-scale open online courses. Several citation analyses have shown that only a relatively weak connection exists between these two thematic communities of interest (Park & Shea, 2020; Weller, 2020; Weller et al., 2018). Furthermore, a recent study analyzed the commonalities and differences of implementation dynamics of OER and MOOC projects in Dutch higher education (Schophuizen et al., 2020), revealing some subtle but important differences when it comes to implementation strategies for open education in higher education.

The work on OER was initiated by the OpenCourseWare Movement and recently translated into a recommendation by UNESCO (UNESCO, 2019). The focus of the OER community has been on the publication of learning resources under an open license to allow the reuse and adaptation of (digital) learning resources. While in early stages of research on OER multiple forms of reuse were explored (Rensing et al., 2005), the prominent 5R framework is frequently used to discuss the dimensions of openness and reuse (Wiley, n.d.), covering five aspects of the use and development of OER: retain, reuse, revise, remix, and redistribute.

Research on MOOCs has focused mainly on challenges arising from large-scale openly accessible courses provided by (formal) higher education institutions (through open-source or commercial platforms) but used for nonformal learning by a variety of learners (Kalz & Specht, 2013). Prominent research questions in this subcommunity deal with design challenges for feedback and assessment (Joksimović et al., 2018; Kasch et al., 2021), self-regulated learning in open courses (Jansen et al., 2020), and last but not least, the fundamental question of how learning can be analyzed and success can be defined in this specific educational context (Henderikx et al., 2017; Rabin et al., 2020a).

Overall, the development of and research on open education is labelled as dynamic and multifaceted, more than just about OER and/or MOOCs (Zawacki-Richter et al., 2020). The underlying theoretical rationale is not without its criticisms, and more empirical evidence is needed in favor of open education. In an assessment of the OER research hub, Shear et al. (2015, p. 21) state that a “critical mass of high-quality and empirical OER research was not available [in 2012],” questioning the overall impact of activities around OER. Knox (2013) criticizes the missing educational concept or vision of OER, the strong emphasis on freedom leading to a devaluation of teachers and educational institutions and finally the unquestioned assumption of an independent and self-regulated learner. Edwards (2015) analyzes the discourse around openness in education and concludes that every definition of

openness also implies a definition of closedness and the value proposition surrounding this dichotomy. Bayne et al. (2015, p. 248) complain that the open education discussion “too often tended towards optimism, advocacy, and conviction.” On the other hand, MOOCs have been criticized for not contributing to democratization of (higher) education (Hansen & Reich, 2015) and for favoring a dominant Western model of education and knowledge (Altbach, 2014).

Despite the tensions identified in the research themes, the term of “open education movement” was coined (Baraniuk, 2008; Conole & Brown, 2018; Farrow, 2017), suggesting a systematic and concerted body of activities around the opening of (higher) education with digital technologies. Weller (2014) even speaks of an “open movement,” stressing the importance of involving activities far beyond the education sector. In this chapter, the existence of an “open education movement” will be analyzed from the perspective of social movement theory (SMT). An analysis will be conducted of the extent to which we can speak of open education movement as a social movement. While this question may seem to be purely academic, the intention is to show its relevance to the identity of the open education community and to help develop a stronger theoretical basis. In addition, some practical consequences of this question will be identified.

The chapter is structured as follows: In the next section, SMT is introduced as the theoretical lens through which open education as a scholarly community will be analyzed. Based on this theoretical foundation, a research framework will be proposed. This framework will then be used to analyze the discourse and activities pertinent to open education. Finally, results of the analysis will be discussed, and implications be drawn for future research and practices in the domain.

---

## Social Movement Theory

SMT is a sociological theory with the aim of understanding and explaining how social movements as collective actions of multiple individuals are formed, developed, and transformed. A working definition of social movements is provided by van Stekelenburg and Klandermans (2009, pp. 20–21) who define social movements as “interlocking networks of groups, social networks and individuals and the connection between them with a shared collective identity who try to prevent or promote societal change by non-institutionalized tactics.” The authors provide a comprehensive overview of SMT and differentiate between structural approaches and social constructivist approaches to social movements.

Structural approaches to social movements study how the social and political context influences the establishment of social movements. Main research directions include the distribution of resources (resource mobilization) and the political environment. Resource mobilization research focuses mainly on internal processes of a social movement and puts less emphasis on grievances. This theoretical stance has been criticized for drawing its assumptions mainly from economic frameworks. Scholars focusing on the political environment of social movements look mainly at external factors influencing social movements. Their main assumption is

that social movements are adapting according to changes in political environments. In contrast, the new social movement (NSM) approach falls under the social constructivist approaches and deals with effects of modernization on marginalized groups of the society. Identity and the construction of identity by these groups are the core topic of this research direction which focuses on the perception and interpretation of material and sociopolitical conditions by individuals and groups. Reality, including threats and opportunities, is socially constructed from this perspective, and group identification plays an important role in the participation in social movements.

Della Porta and Diani (2015) summarize the common research interests of the field of social movement studies as follows:

1. “individuals critical of the status quo and prepared to engage in protest;
2. organizational forms intent on encouraging rank and file participation and bottom-up forms of deliberation;
3. public challenges to powerholders, often linked in chains of protest events;
4. actions providing goods to movement constituencies, and facilitating experimentation with alternative lifestyles” (pp. 4–5).

This summary shows that SMT consists of multiple perspectives to explain human action and social change. In this chapter, SMT will be used as a research framework to analyze whether and to what extent open education can be seen as a social movement. As a research framework, the guiding questions proposed by Della Porta and Diani (2020) will be employed and those four categories are applied to the open education theme. According to the authors, any study of a social movement needs to answer the following questions:

1. **Conflict and protest:** What are the underlying conflicts which open education focuses on? Do these conflicts change over time?
2. **Cultural representations:** What are the cultural representations used by actors in open education in the social conflict? How are problems in open education identified as objects for collective action? How are actors becoming involved in the collective action in open education? How are specific events recognized as part of the same social conflict? Where do cultures and values of open education come from?
3. **Values and collective action:** Which values, interests, and ideas get turned into collective action in open education? What are the mode and costs of this protest? How are the identities, symbols, emotions, organizations, and networks in open education perceived when explaining the initiation and persistence of the collective action? What forms do organizations take to maximize their strength and collective outcome?
4. **Influence of social, political, and cultural context:** How do social, political, and cultural contexts affect the success and forms of activities in open education? How does collective action work against holders of power? How is protest manifested and how does the form of protest change over time?

These questions can serve as a guiding framework to assess the extent to which open education can be perceived as a social movement as proposed earlier by researchers in the field.

---

## Open Education from the Perspective of SMT

### Conflict and Protest in Open Education

What are the underlying conflicts which open education is focusing on? One of the common themes of research and practice in open education is the joint *goal to increase access options to (higher) education with digital technologies*. In terms of conflicts, this notion can be connected to discussions around equality and fair allocation of chances to participate in education. Historically, a specific set of institutions such as open and distance teaching universities was established with the mission to allow flexible access to higher education and to offer options for the so-called “second chance” students, who did not have access to higher education in their initial education (Guri-Rosenblit, 1999). This *institutionalized widening of participation* in higher education has been later extended, via the open courseware movement and the publication of open educational resources, into opportunities to make use of resources from the formal educational system in a nonformal learning context (Sabadié et al., 2014). This central notion of increasing access has been later further extended via MOOCs but with more focus on access to learning opportunities than (reuse of) resources. Without focusing so much on the differences between these two types of activities, we can deduct that one of the central activities of open education is converting formerly inaccessible learning opportunities into public goods via the means of digital technologies.

Can we interpret this as a form of protest? According to Deimann and Sloep (2013), the origins of open education were rooted in dissatisfaction with and protest against the established educational system. This is also in line with earlier understanding of open education in which alternative pedagogical models in school education were subsumed under this concept. Van Mourik Broekman et al. (2014) mention several dimensions of protest underlying open education: protest against austerity, commercialization of higher education, unfair societal allocation of power and resources, and privatization of the public education sector. In this context, research attention has recently been directed towards social justice as a new paradigm for open education (Hodgkinson-Williams & Trotter, 2018; Lambert, 2018). Hodgkinson-Williams and Trotter (2018) approach the topic of social justice with regard to outcomes and processes of open education and a potential “economic maldistribution, cultural misrecognition and political misframing” (p. 207) and provide a wide range of contextual evidence on effects and needs from the context of OER. Lambert (2018) discusses social justice from the dimensions of redistributive, recognitive, and representational justice, and assigns exemplary activities to those categories for which a qualitative content analysis is conducted of 18 so-called “foundational texts.”

It is an open question whether the sharing of resources, provision of access to open courses, or the analysis of social injustice in academic communities can be interpreted as an activity of protest against, for example, unfair distribution of chances to enter (higher) education and whether this activity is a sufficient sign of a social movement. In addition, if these actions take place only inside of academic communities, they mainly fall into the category of conventional actions in the taxonomy of protest developed by Caiani et al. (2012). In this taxonomy, five different levels of protest are differentiated ranging from conventional actions to violent actions. Conventional actions are the lowest level of protest and are represented by lobbying activities, for example. On a higher level are demonstrative actions which are represented by dedicated events and protest activities. Expressive actions address directly sympathizers outside of the social movement. Last but not least, two levels of aggressive actions form the highest level of protest involving illegal demonstrations and violence.

Social movements are, according to Della Porta and Diani (2020), different from other kinds of collective communities. The authors differentiate the so-called “epistemic communities” from social movements and point to the difference in key actors of these kinds of communities: “Epistemic communities involve actors usually endowed with decision-making power and certified knowledge” (p. 28). In this context, we would need to ask ourselves whether and how we include actors with no decision-making power and less certified knowledge into the discourse on open education.

## Cultural Representation

As discussed in the introduction, the cultural representation of the open education community centers around the provision of learning opportunities, either through the publication of resources or access to open courses. Mostly, either institutions or actors from public bodies are involved in publication of resources and development of open courses. The assumed “innovation direction” is here from institutions to an unspecified body of individuals as users of these resources (Rabin et al., 2020b). Much less focus has been on cultural representations which are not coming from institutions or which take other forms. The vast number of learning communities and self-help portals has been, for example, mostly ignored in the discourse on open education although they provide excellent contexts for a different type of educational scenario compared to the classical “course metaphor” (Borkman, 1999). These communities also practice some form of open education which has been widely ignored in the scholarly community. Extending the focus on this type of cultural representations would lead to a more inclusive approach for open education.

While it is a very valid discussion that learning resources financed via public money should be publicly available, the resource-centric perspective on the production of learning material neglects a large part of what education is about and also ignores the conditions under which learners are able to make use of this specific type of educational offer (Knox, 2013). Della Porta and Diani (2020) discuss the

production of public goods as a central activity of social movements but warn at the same time that these kinds of solutions do not “imply redistribution of power nor alterations in social structure, but focus instead on service delivery, self-help, personal and community empowerment” (p. 23). In this context, it is an open question whether the sharing of OER or the provision of access to open courses is sufficient to influence power structures or whether we do not put too much responsibility on the individual learner.

## Values and Collective Action

A third aspect of social movements relates to shared values and collective action. An unquestioned value of open education can be formulated as improving the provision of access to (higher) education for learners who do not have access to learning opportunities for whatever reasons (Kalz, 2014) or phrased differently as the reduction of structural constraints on education. Furthermore, openness has been used as a connector to combine activities in areas like research (open access), scientific practices (open science), or management (open policy) (Weller, 2014). Edwards (2015) provides some examples of potential values underlying openness and open education. He mentions, for example, the need to create more flexible educational careers to ensure employment as one of the motivations and values underlying open education or the accumulation of more cultural capital as a more consumption-oriented foundation of open education.

In terms of addressing and improving access issues to higher education, the focus on resources and course development can be very unspecific compared to dedicated programs for minority groups, for example. In this sense, the investment of resources into unspecific sharing activities might be less effective than a dedicated development effort which puts less emphasis on advocacy or training for licensing than on quality of resources and impact. Interestingly, these economic investment efforts for OER are only calculated, for example, in terms of cost-saving effects on the student side (Hilton III et al., 2014), but other economic and effectiveness dimensions are neglected. In this sense, a broader economic assessment of the investment in the development of open education would be needed which could provide a better picture with respect to effectiveness of interventions. By setting openness and licensing as a “holy grail” of open education, other potential interventions are ignored, potentially resulting in less equality.

Lane (2016, pp. 32–33) differentiates four layers for collective action in open education which all relate to emancipation:

1. “emancipation of people *through* education” whereby education can be a means through which individuals can understand and work against structural constraints in society.
2. “emancipation of learners and teachers *within* education,” referring to overcoming restrictions which the current educational system applies (systematically) to learners and teachers.

3. “emancipation *of* education” which relates to the emancipation of education as a discipline, policy area, and practice from structural constraints.
4. “emancipation *from* organized education,” enabling individuals to become self-regulated learners who can take away some structural constraints in the sense that learning will be possible without dependency on educational institutions.

All these dimensions are subject to collective action in open education and the discourse does often not differentiate between these dimensions and their implications.

## **Influence of Social, Political, and Cultural Context**

As a final dimension, one of the core questions for social movement analysis is the influence of the social, political, and cultural context on a social movement. The strong focus on property rights and alternative licensing options of OER can itself be regarded as a cultural reflex to set something against restrictive use of digital resources. Overall, the increasing commercialization and market-driven innovation of higher education infrastructures is another influencing factor which could motivate others to become an “open education supporter.” The recent decision of the Massachusetts Institute of Technology (MIT) to sell one of the few remaining and largest MOOC platforms to a commercial company (MIT, 2021) is just another brick in the wall of a long history of institutional digital innovation projects which have later lost their open (source) direction and have been taken over by commercial companies. Williamson and Hogan (2021) provide a coherent collection of examples of the intensified commercialization of higher education during the Covid-19 pandemic.

Especially questions related to knowledge infrastructures and resource streams between the public sector and the open education space have not been sufficiently studied. Many assumptions about the replacement of parts of the higher education space with open education have not been met (Rabin et al., 2020b). While open education projects might start initially with the idea of an open knowledge infrastructure (Edwards, 2015; Kalz et al., 2020), these basic assumptions of the digital backbone for open education projects are often not sustained. In this context, we can see that open education can function as a double-edged sword: While striving for more openness in education and less (financial) barriers may result in an improvement on a short-term basis, the uninstitutionalized effort could lead in a longer term to unwanted outcomes such as privatization or the takeover of public infrastructure by commercial companies.

---

## **Discussion**

Open education as a multifaceted concept with many dimensions and topics is entangled in scholarly activities, advocacy activities, political discourse (especially around the UNESCO declaration on OER), and finally training and knowledge sharing activities. This complexity of activities and broadness, combined with an

inconclusiveness regarding the course of actions, target groups, problems to be addressed, and social benefits, contributes to a problematic identification of a real “center” of open education as a social movement.

While open education might be focusing on the surface *social conflicts*, the highly academic nature of discourse undermines the potential to involve other actors in the discourse. What is worthy of notice is the unclear picture of the stakeholders for which the open education scholarly community is working. Who are the specific marginalized and disadvantaged communities which are targeted with open courses, OER, and design approaches for social justice? A logical next step for the open education community would be similar to what the medical research community has realized over the course of the last 10 years. More and more researchers from this community do not talk about stakeholders but *with stakeholders*. Furthermore, many medical conferences engage patients in the academic discourse (Chu et al., 2016) and journals include patients on the editorial board (PatientsIncluded, 2016). For this purpose, a clearer picture of the stakeholders of open education would need to be developed and those stakeholders would need to be explicitly included in the discourse to move open education towards a social movement. This would imply that the disadvantaged learners and learners without access to educational opportunities would be enabled to contribute to the discourse on open education.

Currently, most activities do not contribute sufficiently to *protest* and do not seriously involve other parties in the discourse outside of academia.

The production of public goods as *cultural representation* is one of the central activities of open education with OER and open courses at the center mainly contributing to a reproduction of social norms within the higher education system. *Values* are shared on a high level (access and openness principles) while implications and tensions stemming from these principles are not sufficiently addressed and discussed. By stressing the importance of open and independent learning and publicly available resources, the community might unintentionally contribute to a neoliberal stance on lifelong learning (Barros, 2012) and educational technology (Jones, 2019) in which educational institutions are playing a minor role in the life of individual learners and an autonomous and self-directed learner is taken for granted. Furthermore, Della Porta and Diani (2020) remind us that “producing public goods, or expressing support for some moral values or principles does not automatically correspond to social movement action; the latter requires the identification of targets for collective efforts, specifically articulated in social or political terms” (p. 21). In this light, we should ask ourselves critically whether the licensing of resources or the development and publication of an open course can already be regarded as a social or political activity or whether it is just a side activity and product of another professional context.

The social, political, and cultural context has a high level of influence, but events do not lead necessarily to a “community response” in the way it would be expected from a social movement. In a similar manner, van Mourik Broekman et al. (2014) raise doubts that the uncritical adoption of protest started outside of the higher education context for the discourse inside academia might take away the original intention of this form of protest. Reflecting on the efforts around the UNESCO

declaration on OER and also looking at policy projects on OER in some European countries, one can also ask whether the goals and values are not mistakenly exchanged with the means. It seems that open licensing is the goal and not the means to reach more equality and fairness in (higher) education. Huge investments into the development of OER portals by the European Commission, for example, in the policy support program, have lacked sustainability and no real effectiveness studies of these investments have been conducted. Similar investments have been and will be undertaken in other countries following the UNESCO declaration. In times of scarcity of funding, investment into OER development programs should have as a basis an expected educational effectiveness instead of a value-based belief in openness.

Furthermore, studies have shown that there are more fundamental problems like time and resources which hinder teachers from adopting OER and sharing digital resources (Kreijns et al., 2013), which suggests that awareness and advocacy activities might not be sufficient to realize a more open educational system. It can be assumed that rigorous research on conditions and factors influencing access to education is more sustainable and impactful compared to advocacy and training activities (for example, of faculty members for developing OER).

---

## Conclusions

In this chapter, the arguments for the existence of an “open education movement” are used as a starting point, and SMT is adopted to analyze the field along the dimensions of conflict and protest, cultural representation, values and collective action, and the influence of the social, political, and cultural context. While some activities of open education are identified as practices of a social movement, the field as a whole resembles an epistemic community more than a social movement.

In general, it is also questionable whether the scholarly community of open education should put more effort into developing open education as a social movement. The Covid-19 pandemic has increased inequalities of educational systems worldwide, and a more systematic answer of the scholarly community and policymakers would be needed to make educational systems more accessible and to improve chances for disadvantaged learners.

Currently, activities are shifting from prescriptive and purely value-based advocacy (e.g., “OER are good, commercial licenses are bad”) to evidence-based assessments of effects of open education on socially disadvantaged individuals (e.g., “MOOCs did not democratize education”). Investing more effort into rigorous research, developing a clearer and more inclusive approach to the central assumption of the research field, and steering the field towards an epistemic community would be beneficial for researchers and policy-makers in higher education.

Epistemic communities are depicted by the following traits according to Haas (1992):

- Share a set of beliefs and values as a basis for actions of community members.
- Share a set of causal beliefs derived from an analysis of current practices leading to a set of linkages between policy actions and potential outcomes.
- Share an understanding of validity and criteria for evaluating knowledge in the domain of expertise.
- Have a common policy framework leading to an improvement of human welfare.

Working on an explicit theoretical and conceptual framework in the sense of an epistemic community could increase the impact and coherence of work in the field of open education. Especially the discussion on causal beliefs could improve the rigor and quality of research in the field which would go beyond, for example, classical “license comparison studies” (Wiley, 2021, p. 412).

## Abstract

The origins and evolution of instructional technology and instructional design are treated in this chapter as separate concepts, although having intertwined histories. As with other technologies, their origins can be traced to the scientific discoveries on which they are based. Early in the twentieth century, new discoveries in optics and electricity stimulated educators to the adoption of technological innovations such as projected still pictures, motion pictures, and audio recording. Individuals and, later, groups of affiliated professionals promoted enriching learning by adding visual and, later, audiovisual resources where verbal presentations previously dominated. As radio broadcasting grew in the 1930s and then television in the 1950s, these mass media were perceived as ways to reach audiences, in and out of school, with educative audiovisual programs. In the 1960s, the wave of interest in teaching machines incorporating behaviorist psychological technology

engendered a shift in identity from audiovisual technologies to all technologies, including psychological ones. As computers became ubiquitous in the 1990s, they became the dominant delivery system, due to their interactive capabilities. With the global spread of the World Wide Web after 1995, networked computers took on communication functions as well as storage and processing functions, giving new momentum to distance education. Meanwhile, research during and after World War II prompted a technology of planning – systems analysis. In the 1960s, educators adapted the systems approach to instructional planning, starting the development of instructional systems design (ISD). Since the 1980s, ISD has been the reigning paradigm for instructional design, while instructional design has become the central activity of instructional technology professionals.

**Introduction**

This brief history strives to tell the story of the evolution of instructional design and technology in the field of education. The terms used in the title, *instructional technology* and *instructional design*, are two separate constructs having separate – but intertwined – histories. Here, *instructional technology*, being the overarching construct, will be treated first, with *instructional design* being treated as a later development.

---

**The Origins and Evolution of Instructional Technology**

By definition, the role of technology is to put new scientific discoveries into practical application. Thus, one of the themes running through the history of the field is that new technologies tend to crop up in the wake of new scientific advancements. For example, the invention of the steam-driven rotary press around the turn of the nineteenth century, coupled with the invention of lithography, enabled the mass production of large-format color prints. As they were expensive to produce, a school or university might possess only a few copies of a given artwork or biological illustration; curating and promoting the use of such pictures became part of the job of visual education specialists. Later, the invention of photography added to the stock of images available for use by educators. By the turn of the twentieth century, the invention of the incandescent light bulb made projection of photographic images practical in educational institutions. Edison's invention of the film camera and projector added movies to the inventory of visual education specialists.

By the 1920s, in the USA the National Education Association had created a professional home for visual education specialists, the Department of Visual

Instruction (DVI). After World War II, when magnetic tape audio recording equipment became widely used, the name was broadened to Department of Audio-Visual Instruction (DAVI). As the focus of the field shifted from supporting the use of audiovisual hardware and software to creating and implementing instructional systems, the organization adopted a new name, Association for Educational Communications and Technology (AECT), in 1970 and has continued under that name to the present time.

In response to the continuous parade of innovations in media and advances in learning theory, the leading professional associations have periodically established committees to reflect on the current definition of the field. The first (Ely, 1963) signaled a shift from a product identity to a process identity, although the central axis remained “audiovisual.” By 1977 (AECT Task Force on Definition and Terminology, 1977), the overall self-concept had shifted to “instructional technology” (although the Task Force delineated a distinction between *educational technology* and *instructional technology* and chose the former as the overarching construct). A more recent definition embraces the *educational technology* label and ignores the educational/instructional distinction (Januszewski & Molenda, 2008).

Unfortunately, these carefully crafted definitions have had limited impact on discourse among practitioners. This can be accounted for – in part – by the fact that each new wave of technological innovation attracts advocates for that particular technology. “Educational radio” broadcasters came from the ranks of radio, not education. “Educational television” producers came from the ranks of television. Programmed instruction enthusiasts typically identified with experimental psychology. Computer-assisted instruction (CAI) devotees generally came from the field of computer science/technology. Distance education practitioners were rooted in the traditions of university extension services. As Martin Weller summarizes the situation, “Edtech is also an area to which people come from other disciplines, so there is no shared set of concepts or history” (Weller, 2018, p. 34). The smaller core group of educators who identify as instructional technology professionals generally has had little power or control over developments as massive waves of technological fads and fashions have washed over institutions of education and training. This is the story as observed by those witnesses.

## Hard and Soft Technologies

As civilization advanced, it demanded more and more specialized skills, eventually including reading and writing. To pass along those skills to the next generation required more expertise than could be found in the home or cottage industry, hence the establishment of schools and apprenticeships. Education and training became more organized over the centuries as educators developed new techniques and tools to make their efforts more efficient and effective. Some of these methods could be considered technological in the sense proposed by John Kenneth Galbraith (1967, p. 12), that is, applying scientific or other organized knowledge to the attainment of practical ends. Such developments may take the form of *hard*

technologies, including materials and physical inventions, or *soft* technologies, including special work processes such as instructional design. Throughout the eighteenth and nineteenth centuries, media innovations gradually enhanced the schooling experience. Maps, globes, and scientific apparatus were standard equipment in the better European and American schools and colleges in the eighteenth century, but it was not until early in the nineteenth century that a new general-purpose display format – the blackboard – came into widespread use (Anderson, 1962).

## **Visualizing the Curriculum: The Paradigm of a Concreteness Continuum**

Slide projection evolved from the seventeenth-century hand-painted slides illuminated by oil lamps. This “magic lantern” provided entertainment for theatrical audiences throughout the nineteenth century (Petroski, 2006). Edison’s invention of incandescent lighting by electricity in the 1890s made slide projection affordable, and by the end of the nineteenth century, lantern slides were in common use in education. Edison’s later perfection of the motion picture camera and projector led to the production of nontheatrical short films, beginning around 1910. British and French short-subject films showed amazing sights such as microscopic creatures, insects in flight, and underwater seascapes. Films of news events and travel adventures played to rapt theater audiences.

Silent films began to be used in schools as early as 1910 (Saettler, 1990, pp. 98–99). By the 1920s, educators could find theatrical films edited for special purposes, industrial films, government films, and a smaller number of films produced specifically for the classroom. Despite the marginal value of many of the available films, interest and usage continued to grow, and by the end of the 1920s, many education agencies had units devoted to film or visual education, and thick catalogs documented the thousands of films available to educators.

The field’s initial identity was that of *visual instruction*, a movement within education to surmount the limitations of “verbalism,” that is, reliance on the spoken and written word – lectures and books (Hoban, Hoban, Jr., & Zisman, 1937). The visual instruction movement posited that what really counted was meaningfulness, not just rote memory. Meaningful learning came from rich and varied experiences, as direct and concrete as possible. Where firsthand experience was not feasible, visual images could provide a measure of realism. One could say that the underlying paradigm was that of *concreteness*: provide as concrete a learning experience as possible. Edgar Dale, through his influential textbook (1946), expanded the notion of audiovisual instruction by proposing in his Cone of Experience that learning experiences – including direct personal experiences, field trips, and dramatizations, as well as audio and visual media – could be arrayed in a continuum from concrete to abstract, and each type has a role to play.

## From Visual to Audiovisual Instruction: The Paradigm of Communication Improvement

As early as 1910, various types of phonograph recordings, used mostly for music, were available to the public. Although magnetic tape displaced the phonograph for recording purposes in the 1950s, vinyl records remain in use into the twenty-first century. Records, and later cassette tapes, made it possible to add a soundtrack to filmstrips and slide sets. Thus, the identity of the field became *audiovisual instruction*. By the 1930s, schools maintained equipment pools that contained (in order of frequency) lantern slide projectors, radio receivers, 16 mm silent film projectors, 35 mm silent film projectors, filmstrip projectors, opaque projectors, micro-slide projectors, 16 mm sound film projectors, and 35 mm sound film projectors (Saettler, 1990, p. 234).

### Educational Radio

As broadcast radio stations began to reach mass audiences in the 1920s, governments stepped in to regulate the process. In most countries (other than the USA), broadcasting facilities were directly managed by the government. However, with the founding of the British Broadcasting Corporation (BBC) in 1927, several major countries, including Canada and Japan, followed its model of a quasi-autonomous public corporation. Providing cultural and educational programming was assumed to be a primary responsibility of these organizations; such programs were often among the first to be broadcast. The first school programs began in England in 1926. By the mid-1930s, there were school broadcasting services in virtually every European country as well as in Australia, Japan, South Africa, and India.

In the early 1920s, many American colleges and universities obtained licenses to operate radio stations. A large proportion of these succumbed to competition with commercial stations, but some put down roots. The operations that prospered were the ones in which radio played an integral part in the university's mission – bringing educational opportunities to audiences beyond the campus (Wood & Wylie, 1977). Later federal legislation reserved a portion of the FM radio band for noncommercial stations, giving school systems, universities, and public non-profit groups the chance to reach mass audiences.

From the beginning, educational broadcasts covered the whole range of subjects, including foreign languages, health, social studies, home economics, science, music, and many others, including art. By the mid-1930s, several American radio stations operated by local and state school boards had developed sophisticated educational programming, often incorporating innovative pedagogical techniques. In the UK, BBC programmers worked closely with advisory boards of teachers in every subject area to find niches into which audio material might add value (Bailey, 1957). In 1936, in England and Wales some 4600 schools were registered users (Parker, 1939). However, in the Americas and many European countries, programming tended to be, in the words of Levenson and Stasheff, “informally educative” (1952) rather than

directly instructional. This pattern of consigning programming to a supplementary role was to be repeated with television, programmed instruction, and computer-assisted instruction.

### **Instructional Film**

World War II brought films to the forefront of military training. The British and American armed forces made extensive use of 16 mm films for training and motivational purposes. Between 1941 and 1945, the Division of Visual Aids for Military Training produced over 400 sound films and over 400 silent filmstrips, enabling a military mobilization far broader and faster than the Axis strategists had expected (Saettler, 1990). During the war, as films were being produced and used in training, the US Army commissioned a series of psychological studies (Hovland, Lumsdaine, & Sheffield, 1949) that studied various filmic techniques and their instructional effectiveness. Because of the concentration of time, money, effort, and research expended on these productions, a genre of *instructional film* came into its own.

After the war, instructional film research continued under US Navy sponsorship at Pennsylvania State University (Hoban Jr. & Van Ormer, 1951). Some of the experiments dealt with utilization techniques but most explored presentation variables, such as camera angles, pacing, narration, music, and color (Saettler, 1990). Most of the basic research on visual and auditory perception has been done outside the field of instructional technology. However, a flood of applied research followed the enactment of the National Defense Education Act of 1958 in the USA. Generalizations gathered from the basic and applied research were compiled by Fleming and Levie (1978) in the form of message design principles, principles that have continued to be validated by research in multimedia learning (Mayer, 2014).

### **The Audiovisual Instruction Era**

The period between World War II and the advent of personal computers in 1982 could be characterized as the audiovisual instruction era. Instructional films, 35 mm slide/filmstrip projectors, opaque projectors, radio receivers, and record players were owned by American schools at the rate of at least 1 per 100 teachers by the late 1940s. Television receivers reached this status in 1958 and overhead projectors in 1960 (Finn, Perrin, & Champion, 1962). Magnetic tape recording, invented in Germany in 1935, was introduced to the USA by servicemen who brought back recorders after the war. By 1956, reel-to-reel tape recorders had joined the ranks of media devices found in mass use in schools (Finn et al., 1962). Cassette audio recorders were introduced by Phillips in the Netherlands in 1962 and became the standard audio format in schools around the world by the early 1970s.

The rate of use of audiovisual media by K-12 teachers during this era was strongly affected by accessibility; instructors were likely to use materials that were stored in their own classrooms, somewhat less likely to use those housed in a center in their building, and even less likely to use items, such as 16 mm films, that had to

be delivered from outside the building on a scheduled basis. Evidence from various sources indicates that the average teacher used about one film per month (Cuban, 1986, pp. 14–18). The reasons given by teachers for the low rate of use of film and similar media, in addition to accessibility, were lack of training with the technology, unreliability of projection equipment, limited school budgets (for rental of films and purchase of projectors), and difficulty of integrating the material into the curriculum. Not coincidentally, surveys in the 1990s and 2000s identified the identical barriers to teachers' use of computers (National Center for Education Statistics, 2000).

During the postwar period, communication theory became a dominant paradigm both in the physical and social sciences. Flowing from Shannon and Weaver's (1949) information theory, through Wiener's (1950) cybernetics and Berlo's (1960) process of communication model, thinkers in instructional technology began to view teaching-learning problems as communication problems. Improvement of communication depended on detecting where the weak points in the process were and ameliorating them – choosing a more visual medium, building more redundancy into the message, matching the receiver's language capability better, providing the sender with better feedback about the receiver's response, and the like. This perspective is reflected in the name adopted in 1970 by the Association for Educational *Communications* and Technology (AECT).

### **Television: Educational and Instructional**

Television broadcasting began on a small scale before World War II but did not blossom until after the war. In countries such as Japan, the UK, and other European nations, it was already assumed that the purpose of broadcasting was to provide cultural enrichment as well as entertainment, so news, public affairs, science, and the arts were part of the program schedule right from the beginning. In the USA, the template established with radio – a program schedule heavily dominated by commercially sponsored entertainment – was carried over to television. To compensate for this gap, in 1952 the Federal Communications Commission (FCC) reserved 242 channels for noncommercial licenses. By 1958, 35 “educational television” (ETV) stations were on the air; by 2020, there were 330 stations in all 50 states that were members of the Public Broadcasting System (PBS), a partially government-supported agency formed in 1970. Although many of these stations are affiliated with colleges and universities, their programming is dominated by news, public affairs, science, history, and the arts – programs of general cultural “uplift,” but not intended to fulfill an instructional function.

In the UK, the BBC began school television broadcasts in 1957; by the mid-1970s, over 80 percent of all schools were making regular use of BBC programs (Mohanty, 1984), a pattern that carried on into the twenty-first century. Guided by a school broadcasting council that included strong representation of teachers, programs were carefully designed to be integrated into the national curriculum. In other European countries, the general pattern has been for the state television corporation to devote a small percentage of its broadcast hours to programming aimed at in-school audiences and adult education. Like the UK, Canada also operates a national television network, the CBC, which began to provide school TV broadcasts

in 1952. They continued to offer a limited schedule of in-school programs throughout the 1960s and 1970s, as the various provinces gradually undertook their own program production. Like the USA, Canada's K-12 education system is controlled by provincial authorities rather than the national government. By the mid-1960s, most of the provinces were producing instructional television (ITV) programs tailored to their specific curricular needs.

In the late 1950s and through the 1960s, there were directly instructional programs distributed on a regional basis in the USA, such as the Eastern Educational Network (EEN) and the Midwest Program of Airborne Television Instruction (MPATI), and a few on a national basis, such as *Continental Classroom*. For reasons too numerous to cover here, the concept of replacing many teachers with a single master teacher proved unsuccessful. Instead, schools and colleges, with subsidies from the Ford Foundation and the federal government, established their own local ITV operations, using closed-circuit transmission within one campus or microwave transmissions to link multiple campuses. After the popularization of videotape recording, which became video cassette recording in the 1970s, ITV programming was increasingly created and used as off-the-shelf packaged units rather than being received through broadcasting (Thornton & Brown, 1968).

As with educational films, ETV and ITV programs tended to emulate the familiar genres: lecture, demonstration, voice-over visualization, interview, panel discussion, dramatization, field trip, or documentary (Wood & Wylie, 1977, p. 259). American productions, particularly those beamed to college audiences, tended to be more verbal – the so-called talking heads – than European productions (Tanner & Woerdehoff, 1964). European programs, particularly those of the BBC, were notable for their emphasis on visualization. The BBC collection became a major international archive of exemplary programming that was drawn upon by producers from around the globe. A break from this expository presentation pattern began in the 1960s, influenced by the so-called cognitive revolution, which suggested that television should be participative rather than passive (McBride, 1966). This movement eventually led to the production of several series, especially in science and social studies, that portrayed problematic situations and invited learners to discuss them. The Jasper Woodbury Problem Solving Series, incorporated in videodiscs, represented the culmination of this movement (Cognition and Technology Group at Vanderbilt, 1992).

## **Behaviorism and Programmed Instruction: The Paradigm of a Technology of Teaching**

The term *behaviorism* refers to several related theories in psychology. One of them, radical behaviorism, has had the greatest practical impact on instructional technology due to the application of its primary technique, operant conditioning, to teaching-learning problems (Burton, Moore, & Magliaro, 2004). B.F. Skinner's analysis of the problems of group-based traditional instruction (Skinner, 1954) led him to the invention of a mechanical device for applying operant conditioning to

cognitive learning. Referred to by others as a “teaching machine,” the device controlled the arrangement of stimuli, responses, and reinforcers according to reinforcement principles. Within a few years, inventive publishers devised ways to arrange these conditions in the form of a book rather than a machine, and programmed instruction lessons in book format were published in great profusion in the 1960s. However, the teaching machine did not disappear; it continued to be developed and profited from the increasing availability of computer processing, re-emerging in the 1980s as computer-assisted instruction.

Among programmed instruction advocates, attention gradually shifted to the process of designing self-instructional materials. B.F. Skinner came to refer to his development methods as a *technology of teaching* (1965, 1968). Thereafter, *technology* increasingly took on the dual meanings of “application of scientific thinking” – or soft technology – and the various communications media and devices or hard technology.

The first attempts to use computers to present and control programmed instruction began in the early 1960s with mainframe computers. The early experiments in CAI began just at the time that programmed instruction was at its peak, so many of the early CAI programs followed a drill-and-practice or tutorial format, similar to programmed instruction. For example, beginning in the mid-1960s, the CAI research and development program at Stanford University created successful drill-and-practice materials in mathematics and reading, later adding foreign languages (Saettler, 1990).

CAI programs more adaptable to individual differences were developed in the Time-shared Interactive Computer-controlled Information Television (TICCIT) project at Brigham Young University in the 1970s after the invention of the microprocessor led to the proliferation of “mini-computers.” Although they produced successful programs in mathematics and English composition, both the Stanford and TICCIT programs failed to gain major adoption in their intended sectors, K-12 and community college education (Saettler, 1990).

The Programmed Logic for Automatic Teaching Operations (PLATO) project at the University of Illinois began in 1961, aiming to produce cost-efficient instruction using networked inexpensive terminals and a simplified programming language for instruction, TUTOR. Most of the early programs were basically drill-and-practice with some degree of branching, but a wide variety of subject matter was developed at the college level. Over time, terminals at outlying universities were connected to the central mainframe in a time-sharing system, growing to hundreds of sites and thousands of hours of material available across the college curriculum. The PLATO system pioneered many applications that later became standard Internet formats – a graphical Web browser, online forums and message boards, email, chat rooms, instant messaging, remote screen sharing, and multiplayer games – leading to the emergence of what was perhaps the world’s first online community (Woolley, 1994). PLATO continued to grow and evolve right through the early 2000s, finding a niche in military and vocational education.

“Intelligent tutoring” systems continue to be developed, incorporating artificial intelligence to allow more adaptation based on users’ backgrounds, past

performance, and current mastery – for example, AutoTutor (Graesser, 2016) and TutorIT (Scandura, 2015) – although such programs remain expensive and limited in scope.

The role of computers in education began to change dramatically with the development of “microcomputers” in the 1960s and 1970s. Computers designed for personal use became increasingly commercially successful after the introduction of new models in 1977 by Apple and RadioShack and in 1981 by IBM, and as more people grew accustomed to using a personal computer, they became more and more popular in schools. Previously, students encountered mainframe or mini-computers in labs, where they served as tutors, typically controlling drill-and-practice exercises. Now both students and teachers could have access to user-friendly desktop computers in the classroom and at home to use as productivity tools – word processing programs for writing, spreadsheets for organizing quantitative data, and presentation software to create graphs and slide shows.

Throughout the 1980s, school adoption of computers increased at a steady rate. By 1990 several countries in Europe and North America had reached the plateau of having approximately one computer per classroom. However, as had been discovered earlier in the audiovisual era, access to the hardware does not equate to use (Plomp & Pelgrum, 1991; Pelgrum & Plomp, 1993). In these early years, student usage was primarily to learn *about* computers rather than to learn *with* computers. Building on the earlier Plomp and Pelgrum research, an international survey involving 22 countries (not including the USA or the UK) in 2006 found that virtually 100% of students in those countries had access to computers (Law, Pelgrum, & Plomp, 2008). However, teacher adoption varied greatly from place to place, from 20% to 80%, and increased access to computers did not correlate with students using them to master vital curricular skills. As seen in earlier audiovisual research, teachers’ pedagogical orientation, as well as practical hurdles, determined how seriously they embraced the new technology to pursue curricular learning goals.

As profoundly as personal computers changed the information environment in the 1980s, the advent of the Internet in the 1990s changed it even more. The rapid increase in connections to the Internet in the early 1990s vastly expanded the potential for sharing information at a distance. As the World Wide Web became the most popular Internet protocol by around 1993, it became the de facto standard platform for sharing resources.

---

## The Origins and Evolution of Instructional Design

The construct that is nowadays known as *instructional design* originally was referred to as *instructional systems design* (ISD). This construct represents a synthesis of developments that arose from different fields of study – especially industrial training protocols, military systems analysis, behavioral psychology, and pedagogical research. Each of these tributaries viewed ISD through a different lens, but their insights converged around a process that has similar features. Leslie Briggs’s (1977) definition describes this synthesis:

Instructional systems design—a systematic approach to the planning and development of a means to meet instructional needs and goals; all components of the system (objectives, instructional materials, tests, etc.) are considered in relation to each other in an orderly but flexible sequence of processes; the resulting delivery system is tried out and improved before widespread use is encouraged. (p. xxi)

Each of the tributaries is described below, followed by the story of how these influences flowed together to create the contemporary construct of *instructional design*.

## **Tributaries to Instructional Design**

### **Industrial Training During Wartime, 1918–1945**

When the USA entered World War I, the number of men who enlisted in the military created a critical skill shortage in the shipyards and other defense industries. The US Shipping Board engaged Charles R. Allen, a vocational educator, to devise a training system to fill the void (Griffiths, n.d.). Allen’s four-step system, characterized as “Show, Tell, Do, Check,” and his method for analyzing job tasks (Allen, 1919) were highly detailed and were used in a highly standardized fashion at hundreds of defense plants. A similar situation arose when the USA entered World War II in 1941. The Training Within Industry (TWI) Service built on Allen’s work to create a standard training methodology that was implemented in over 16,000 defense plants in the USA, UK, and Canada (Griffiths, n.d.). After the war, the program was disbanded, but TWI was exported to Japan and Europe to help rebuild their industrial capability. Ironically, the methodology returned to North America when Toyota and other manufacturers established plants in the USA, bringing back TWI as part of the *kaizen* (continuous improvement) system (Dinero, 2005), and was still being applied into the 2020s.

TWI was not a direct contributor to the concept of instructional design, but the TWI system gives industrial training a standardized template for the design and delivery of training, establishing a widespread corporate mentality attuned to a standardized approach to training design, such as the systems approach.

### **Military Research and Development, 1941 Through the Early 1950s**

The systems approach traces its origins to military research during World War II. An analytical technique that grew out of submarine hunting was called *operations research*, in which computers were used to make the calculations required. After the war, this approach to analyzing, creating, and managing man-machine operations, now referred to as *systems analysis*, was applied to the development of training materials and programs.

During the postwar period, each of the US military services had developed its own model for training development, all of which were based on the systems approach, a soft science version of systems analysis (McCombs, 1986). In the 1950s, the military services issued regulations specifying that newly developed weapons must be treated as “man-machine *systems*,” with operator training integrated into the total package

provided by contractors (Dick, 1987). As the notion of *systems approach to instruction* evolved, it came to mean an approach that is both systemic and systematic: viewing a teaching-learning situation holistically and paying attention to the interplay of forces among the parts while devising solutions to problems in a step-by-step manner.

### **Programmed Instruction and the Development Process, the Late 1950s**

Programmed instruction (PI), discussed above as a psychological technique that evolved into a technology, specified a process for developing PI software. Since reinforcement theory called for practicing mostly correct responses, each frame of the program had to be tested for efficacy. In fact, developmental testing was a mandatory specification for materials destined for the military training market. This demanded a commitment to evaluation and revision – “developmental testing” – far beyond what had been typical in the past. So the PI development process that evolved was characterized by careful specification of objectives, active responses, immediate feedback, and repeated rounds of testing and revision. Gradually, PI developers began to realize that it was the painstaking development *process* – more than the PI *format* itself – that made PI successful, epitomized by Markle and Tiemann (1967) in the phrase “programming is a process.”

### **From Military Research to Pedagogical Principles, the 1960s**

By the mid-1960s, prominent educational psychologists Robert Gagné (1965) and Robert Glaser (1962) were aggregating findings from research on learning in the military and industrial realms, as well as in schools. They were advocating instructional improvement from the standpoint of emerging psychological principles but also placing these principles under a “systems” umbrella. These highly influential works did not attempt to lay out specific detailed procedures or models for ISD, but they did provide the pedagogical rationale for an approach such as ISD.

### **Societal Pressures Forge a Synthesis**

By the 1960s, socioeconomic conditions in the USA became more receptive to technological solutions to problems in education and training. First, the “baby boom” of the immediate postwar period meant a rapidly growing population of school-age children, threatening to overwhelm conventional educational facilities, encouraging a search for technological tools to make teaching less labor-intensive. Second, the Cold War meant an adversarial posture between the Western European and American allies and the Soviet Union, which had demonstrated its technological superiority with the launching of Sputnik in 1957. The American response included the National Defense Education Act of 1958, which prioritized education in science and technology. Third, the 1960s was an era of social upheaval in North America and Europe, leading to new government programs to ameliorate poverty, including the Great Society social programs of President Lyndon Johnson.

The Job Corps, created in 1964, provided general and vocational education, technical training, and work experience at residential centers for young people

from poverty backgrounds. Overnight a huge market was created for self-instructional materials for the tens of thousands of Job Corps learners. Thus the “learning industry” was launched. Companies such as GE, Westinghouse, Litton Industries, and Morton Thiokol established large units to create individualized materials and to manage learning systems. Several future contributors to the ISD movement, including Robert Morgan, Robert Branson, and Donald Tosti, among others, gained firsthand experience working in the learning industry on Job Corps projects (D. Tosti, personal e-mail communication, July 24, 2008).

Federal R&D funds from the Elementary and Secondary Education Act and the Higher Education Act of 1965 supported a large number of academic projects aimed at developing and testing systems approach models. Barson’s Instructional Systems Development project, conducted at Michigan State University and three other universities, produced an influential model and a set of heuristic guidelines for developers (Barson, 1967). During this same period, Leonard Silvern at the University of Southern California began offering the first course in applying the systems approach to instruction, “Designing Instructional Systems,” which was based on his military and aerospace experience. He also produced a detailed procedural model that influenced later model builders (Silvern, 1965).

In the early 1970s, Florida State University was selected by the US Department of Defense to develop procedures to substantially improve Army training. The ISD procedures developed for the Army evolved into a model that was adopted by the Army, Navy, Air Force, and Marines, called the Interservice Procedures for Instructional Systems Development (IPISD) (Branson et al., 1975; Branson, 1978). The IPISD model eventually had enormous influence in military and industrial training because its use was mandated not only in all the US armed services but also among defense contractors. The many and varied ISD models that followed differed in details but typically adhered to a common conceptual framework: analyze, design, develop, implement, and evaluate. This conceptual framework came to be called by its acronym, ADDIE (Molenda, 2003).

## **Critiques and the ISD Concept Today**

In the 1970s and 1980s, advocates for the systems approach attempted to promote its use in K-12 and higher education. These efforts struggled to gain traction, for reasons related to the social and economic dynamics of these institutions. However, ISD was welcomed in corporate and military training, where it became the reigning paradigm as a way to standardize design practices and make training more efficient and effective. By the early 1980s, more than 40 different ISD models sharing congruent “ADDIE” features were being used (Andrews & Goodson, 1981). By the end of the 1980s, skill in instructional design was viewed as the core competency of the instructional technology professional. By contrast, the development and production of audiovisual materials – the previous mainstay of the profession – became a niche specialization, one that was often outsourced.

In the 1990s, advocates of constructivism raised questions about many instructional practices, including those associated with ISD. Constructivism may be viewed as a challenge to ISD either at the level of selecting instructional methods or at the broad philosophical level (Dick, 1997). At the instructional methods level, constructivism is a label for a learner-centered pedagogy based on widely accepted principles from cognitive psychology. The ISD process does not mandate any specific instructional methods. In fact, one of the classic works in ISD (Reigeluth, 1999) provides a compendium of instructional strategies and tactics available for use at the “design” stage of ISD, the majority coming from the cognitive perspective. Indeed, the psychological underpinnings of ISD have evolved over time, expanding upon its original behaviorist bias. After two decades of debate over the one “correct” theory to inspire instructional design, there seems to be a new consensus, represented by Willis (1998), that an eclectic posture is warranted. As he points out, “strategies developed within one paradigm are used by those who support another” (p. 15), indicating that practitioners continue to adapt on a pragmatic basis.

A more recent alternative paradigm is the Successive Approximation Model (SAM) (Allen & Sites, 2012), which specifies an iterative process, beginning with a rough prototype modified through cycles of evaluation and revision. However, the notion of iterative progression toward a more finished product is central to ISD, as is evident in the earliest ISD textbooks and also the more recent. For example, in Handshaw’s model, “prototype” appears at the center of the model (Handshaw, 2014). Another popular contemporary ISD textbook advocates a model in which evaluation and revision encompass every step in the process (Morrison, Ross, Morrison, & Kalman, 2019).

One of the most publicized critiques from the corporate domain (Gordon & Zemke, 2000) laid out a broad array of criticisms of an anecdotal nature. After a vigorous debate about the supposed deficiencies presented in the original article, Zemke and Rossett (2002) concluded that the flaws attributed to ISD lay more in how the process was executed rather than flaws in ISD as a conceptual framework.

Other critics feel that ISD, even if implemented adequately, still has deficiencies that limit its comprehensiveness. They suggest that design traditions in other disciplines – such as art, architecture, and software engineering – offer alternatives worthy of consideration (Molenda & Boling, 2008, pp. 119–122; Gibbons, 2014). Others are concerned about the extent to which clients or users are involved in the design process. Carr-Chellman and Savoy (2004) discuss a range of design approaches from user-based, to user-centered, to truly user-controlled or emancipatory design.

In the twenty-first century, ISD continued to enjoy widespread support, not only from practitioners but also from thought leaders. Prominent consultants, such as Darryl L. Sink & Associates (Sink, n.d.) and Handshaw Inc. (Handshaw, 2014); leading textbook authors, such as Gary Morrison and co-authors (2019) and Walter Dick and co-authors (Carey, Carey, & Dick, 2022); and the major performance standards organization, the International Board of Standards for Training, Performance and Instruction (IBSTPI) (Koszalka, Russ-Eft, & Reiser, 2013), all continue to champion the systems approach as the standard for instructional design.

---

## Conclusion

The field and profession of instructional technology has been evolving for over a century, beginning with the visual instruction movement, which promoted the use of slides and silent films for schools, colleges, and adult education. Technological innovations created new opportunities to expand the scope and refine the techniques of audiovisual instruction. US government investment in science and technology in the 1950s and 1960s built up the technological capacity of schools and colleges in the USA and drove research and development on a wide range of technological innovations, including psychological technologies. The process of instructional systems design grew out of military research melded with academic research on the instructional process. In the half century since its inception, ISD became and remains the dominant paradigm in the field of instructional design, and instructional design – intertwined with distance education – has become the central focus of the instructional technology profession.

The phenomenon that became known as *distance education* began outside the realm of instructional technology. Offering university credit for nonresidential study first gained serious traction in the mid-nineteenth century when an “external programme” was chartered at the University of London. This model was emulated at the University of Chicago and, later, Columbia University and the University of Wisconsin in the USA late in the nineteenth century as *correspondence study* (Molenda & Subramony, 2021, p. 12). When radios became widely available in homes, “schools of the air” emerged, often as part of the outreach efforts of universities. The correspondence-study model went through a paradigm shift in the 1970s, led by Britain’s Open University, which employed broadcast radio and television supplemented by print and audio materials to present new material to learners. Students interacted with tutors, either at local learning centers or via telephone, to work through the material and complete assignments, with credit granted based on performance on coursework and examinations (Molenda & Subramony, 2021, p. 13). The label of *distance education* began to predominate, and its high-technology delivery system brought it into overlap with the world of instructional technology. This overlap only grew larger as distance education programs moved more and more toward online delivery.

As the delivery systems for technology-based instruction shifted from inside the classroom, to transmission through broadcast media, to incorporation in networked computers, to sharing via World Wide Web, instructional technology evolved from a field based largely in North America and Western Europe to one that is thoroughly global in practice and in perspective.

## Abstract

Over the past 25 years, digital education has risen to prominence. It has a direct relationship with open education, which can be considered an umbrella term. In this chapter the rise of digital education is explored through five specific educational technologies. These technologies – the web, Learning Management System (LMS), blogs, social media, and Massive Open Online Courses (MOOCs) – all raise issues of control and ease of use. They also have a direct impact on different aspects of open education, which in turn helps inform their development. This chapter sets out the multiple interpretations of open education and their overlap with digital education. By then exploring five educational technologies, common themes are extracted which highlight this intersection of digital and open education.

## Keywords

Digital education · Online education · Massive Open Online Courses (MOOCs) · Learning Management System (LMS) · Virtual Learning Environment (VLE)

## Introduction

Open education is a broad term that has itself undergone evolution and transformation. Weller, Jordan, DeVries, and Rolfe (2018) used a citation analysis method to investigate different clusters of publications which were associated with open education. This revealed eight distinct categories, namely:

- Distance education
- Open education in schools
- E-learning
- Open Education Resources (OER)
- Massive Open Online Courses (MOOCs)
- Open Practices
- Social Media
- Open Access Publishing

There was scant overlap between these clusters of publications, so authors of MOOCs articles, for instance, rarely referenced work on distance education. What this analysis reveals is that open education is not a single entity and practitioners can occupy one aspect with little or no intersection with other forms. For the purpose of this chapter, it also highlights the significance of digital education to different forms of open education. With the exception of earlier articles on distance education and open education in schools, most of these categories have arisen specifically as a function of digital technology. This can be seen with the early shift to publications focusing on “e-learning” in the late 1990s, to MOOCs and OER which are driven by the ability to share resources easily and globally.

In this chapter this trajectory of digital education will be explored through an analysis of several key educational technological developments. The term educational technology is, like “open,” a broad and contested one. In this chapter it encompasses technological developments applied in education, so includes not only specific technologies such as Twitter, but also broader applications of technology, such as learning analytics. Each of the selected technologies has an impact on some aspect of open education, but it is the cumulative effect that is most significant. The intention of such an approach is partly to provide a useful historical perspective, particularly for those new to the field, and also to provide an analysis of how open education is influenced by technology. A more detailed historical analysis from a purely educational technology perspective, rather than an open education one is provided in *25 Years of Ed Tech* (Weller, 2020). Open education, at least for some of the categories provided above, is often seen as synonymous with digital education, and so there is considerable overlap between these two accounts. Zawacki-Richter et al. (2020) note the “octopus-like” nature of the term “open” with many tentacles connected to one central concept. These tentacles reach into many different areas, such as MOOCs, OER, open scholarship and open data, each of which itself intersects with aspects of digital education.

Digital education is often, rightly, portrayed as a rapidly changing field, with new technologies, issues and developments arising every year. This sense of rapid change

is sometimes used as a motivation or threat to educators to embrace the latest form of technology, otherwise it will be too late to catch up. For example, Rigg (2014) asked “can universities survive the digital age?” suggesting that universities are too slow to change and are irrelevant to young people embedded in their fast-moving, digital age. This type of article is not uncommon, for instance Janssen (2021) decries “dear professors, why are you so hesitant to learn something new? . . . Don’t you love challenging yourself to think in new and different ways? I’m baffled by some of the aversion to 21st-century demands and opportunities.” These types of articles both underestimate the degree to which educators do engage with new technology and also overestimate the digital natives-type narrative that all students want their education to be the equivalent of Instagram. Fullick (2014) highlighted that this imperative to adopt all technological change immediately and without question has a distinctly Darwinian undertone: “Resistance to change is presented as resistance to what is natural and inevitable” (para. 3).

Engagement with digital education requires practitioners to maintain a delicate balance therefore between succumbing to hype and rhetoric and rejecting all new claims and approaches. One way to navigate this tension is to acquire a certain protection afforded by an historical perspective. However, the digital education field is rather poor at recording its own history and reflecting critically on its development, as if there is no time to look in the rear-view mirror in a field that is solely interested in the future. It is easy to find books about the future of digital education, but relatively difficult to find ones about its past. This historical amnesia is in part the result of a year-zero mentality in the field, for instance, during the MOOC rush of 2012, there were many “new” discoveries about online learning reported which were already tired concepts in the online education field.

By adopting an historical perspective in this chapter then the intention is to counter some of this year zero mentality, and demonstrate the importance of digital education to different aspects of open education. A short note on definitions first though: digital education is a loose term, and at its most literal interpretation could encompass a lecturer using a PowerPoint presentation or writing a book using Word. Such interpretations would not address the more interesting aspects of changing practice in education. Digital education should therefore be interpreted as a convenient shorthand for the intersection of digital, networked and open practices in education. For example, preparing slides for a lecture in PowerPoint to be presented in a face to face lecture and stored on the lecturer’s hard-drive is not really an aspect of digital education, but creating an online webinar which is openly accessible and sharing the content under a Creative Commons license afterward provides an example of the new possibilities (and associated issues) that are under consideration.

---

## Digital Developments

This section will examine the rise of digital education through the lens of different technologies. In this chapter, five significant educational technologies have been selected. The choice of these is subjective, based on the author’s perception of their

impact and relevance. Obviously other technologies could be proposed and might provide a different perspective.

## The Web

The web is probably the most significant of all the technologies relating to digital education, as it laid the foundations for all that followed. While the story of the invention of the web is reasonably well known, it is worth revisiting with the knowledge of how it developed, and to identify the foundations in that development that have come to shape so much of digital education.

In 1989, Sir Tim Berners-Lee was working as a software engineer at the large particle physics laboratory, CERN (Conseil Européen pour la Recherche Nucléaire, or European Council for Nuclear Research). With scientists from around the world working on different projects and generating large amounts of data and findings, Berners-Lee (n.d.) identified that they had difficulty in sharing information, saying that “in those days, there was different information on different computers, but you had to log on to different computers to get at it. Also, sometimes you had to learn a different program on each computer” (para. 1).

By 1990 Berners-Lee had developed four technologies that made the web functional and that still underpin it:

- HTML: Hypertext Markup Language, an easy to use language to produce web documents.
- URI: Uniform Resource Identifier (also known as URL for Uniform Resource Locator), a means of giving any page on the web a unique address so it can be linked to and located.
- HTTP: Hypertext Transfer Protocol, a data transfer method that allows web resources to be retrieved across the internet.
- Web browser: a piece of software that utilizes the previous three technologies to allow a user to navigate the web.

The fundamental design principles were as significant as the specific technologies in the development of the web. Berners-Lee (1989) identified that for any such system to succeed it needed to be open, and not a proprietary system owned by any one corporation. The technical attributes of the web can also be seen as giving rise to its social attributes, and why it is such a fundamental driver for openness in education. It was designed as a communication system, around principles of robustness, decentralization and openness.

From these technological features a system evolved which had no central authority, meaning that it was difficult for established agencies to control what was published on the web. What anyone could publish and debate was not governed or censored.

By 1995, the web browser was becoming reasonably commonplace, with Netscape dominating. At this stage, the web still required a degree of technical expertise and was awkward to use, but it was on the way to becoming easy enough, and sufficiently

interesting, to be moving beyond purely specialist interest. People regularly made proclamations that no-one would shop online, or that it was the equivalent of Citizen Band radio. Even at the time, these seemed misguided: we could not predict smart phones and ubiquitous Wi-Fi but being able to dial up and connect to information sources anywhere was always going to be revolutionary – and particularly so for education. What the web browser provided was a common tool so that specific software was no longer required for every online function. Prior to this file transfer was performed through File Transfer Protocol (FTP), email through specific clients, bulletin board systems through software such as FidoNet, and so on. The browser provided the potential to unify all these, and more, in one tool.

Even in the simple design afforded by hand-crafted HTML pages, the nascent possibilities of the web for education were evident. Firstly, it made communication, and as a result, networking, much easier. Even though social media didn't exist yet, it was still possible to find the work of a scholar at another university and send them an email. Secondly, the uploading of publications to your own website marked the beginning of consideration about the dissemination of knowledge and the relationship with publishers which would lead to much of the open access developments. Thirdly, academics began to share teaching resources in this way, which as with publications, would plant the seeds of the open education movement. Most significantly, educators began to explore how it could be used in teaching, and the e-learning boom of the late 1990s took off.

Therefore, in this early development of what became known as Web 1.0 we can see the important aspects of what the web gave education – the freedom to publish, communicate, teach and share. For distance education, which had previously relied on expensive broadcast or shipping physical copies of books, videos, and CDs, this was a significant change. It not only altered how single function distance education institutions such as the Open University operated, but also lowered the cost of entry into the distance education market, so now all other universities could effectively become distance, or hybrid, education providers.

In summary, the web laid the foundation for nearly all the technologies that follow in this chapter and is the one we are still feeling the impact of most keenly. Much of digital education is essentially a variant on the question: what does the web mean for us? In teaching, the development of Learning Management System (LMS), OER, and MOOC, as well as related pedagogic approaches, are all examples of this. In research, the use of blogs, analytics, and Web 2.0 tools have all been significant. For academics and universities responding to the cultural shifts caused by social media, video, and the dark side of the web an understanding of these tools has become strategically important. The removal of the publication filter that the web provided was often touted as the most significant socio-technological change since the invention of the printing press (e.g., Giles, 1996) and even now that view does not seem like hyperbole.

## **LMS**

Arguably the most successful education technology and the one that has had the biggest impact (for good and bad) is the LMS or Virtual Learning Environment

(VLE). The LMS provided an enterprise solution for e-learning for universities. It stands as the central e-learning technology, despite frequent proclamations of its demise. Prior to the LMS, e-learning provision was realized through a variety of tools, for instance, a bulletin board for communications, a content management system, and home-created web pages. The quality of these solutions was variable, often relying on the enthusiasm of one particular devotee. The combination of tools would also vary across any one university, with the medical school adopting a different set of tools to engineering, which varied again from humanities, and so on. A number of tools such as Virtual-U and FirstClass began to emerge in the 1990s which combined some of these functions.

As e-learning became more central to university provision, both for blended learning and fully online, this variety and reliability became more of an issue. The LMS offered a neat collection of the most popular tools, any one of which might not be as good as the best of the breed-specific tools but good enough, as the web browser had done earlier for internet functions. It allowed for a single, enterprise solution with associated training, technical support, and helpdesk to be implemented across an institution. The advantage of this was that e-learning could progress more quickly across an entire institution if it was driven by strategy. However, over time this has come to seem something of a Faustian pact, with institutions finding themselves locked into contracts with vendors.

LMS uptake grew significantly over the first half of the 2000s, and by 2005 nearly all higher education institutions had deployed an LMS, but only 37% had a single one, with others operating multiple systems, with the intention to move to a single system (OECD, 2005, p. 124).

It has often been noted that when a new technology arrives, it tends to be used in old ways before its unique characteristics are recognized. This approach applied to much of the early implementation of the LMS. In order to smooth the transition to the online environment, developers started by implementing a familiar model, the virtual classroom. Conole, de Laat, Dillon, and Darby (2008) found that the LMS was often used as a place to dump notes and to replicate lectures rather than engage in more experimental pedagogies. In this approach, content that can be analogous to lectures is laid out in a linear sequence with discussion forums analogous to tutorials linked to this. This approach should have been an initial step to greater experimentation with online learning, but many institutions became “stuck” at this stage, and the LMS is a primary cause of this. As was seen in the COVID-19 pandemic, this model was still in operation with most universities adopting online lectures via technologies such as Zoom.

One of the issues with enterprise systems such as the LMS is that they require significant investment in terms of finance, expertise, time, and resources. They thus gain a momentum of their own. The reservation many educators have with the LMS is not necessarily the actual technology but rather the institutional “sediment” that builds up around it. For the LMS, this sediment can be seen in the structures that accrue around the system. Institutions invest significant amounts of money on technology and employ people who become experts in using that technology. Accompanying this, they develop administrative structures and processes that are

couched in terms of the specific technology. There are roadmaps, guidelines, training programs, and reporting structures, which all help to embed the chosen tool. This creates a form of tool-focused solutionism – if an educator wants to achieve something in their course, and they ask their information technology (IT) services department or educational support team for help, the answer will often be couched in terms of the question, “What is the LMS way of implementing this?”

There have been premature proclamations of the death of the LMS (e.g., Clay, 2009; Weller, 2007) but it is still going strong. Much like the lecture in higher education, reports of its demise, it seems, are always overstated. The Irish Learning Technology Association published a special issue in 2018 which highlighted the ongoing impact of the LMS, by analyzing responses to the VLEIreland survey, a cross-institutional survey of students in Irish higher education over a number of years. McAvinia and Risquez (2018) concluded that far from fading, the VLE has evolved:

The newer VLEs and upgrades of the “traditional” brands offer features such as integrated social media tools and e-portfolios, and have lost the visual cues tying them to the classroom, such as book and blackboard imagery. The regeneration of the VLE is remarkable. (p. ii)

Indeed, the robustness of the LMS is one of its main attractions. As institutions begin to offer more provision through their LMS they are also acquiring more reliable data, which enables them to understand learning patterns and behaviors better (e.g., Holmes, Nguyen, Zhang, Mavrikis, & Rienties, 2019). The LMS is at the centre of much of the work in digital education, and it can often be an unglamorous role ensuring that a system works effectively for thousands of students. Like universities themselves, part of the appeal of the LMS is its steadfast nature: experimenting with people’s education is not something to be done lightly. But there is a balance to be struck between allowing freedom, innovation, and experimentation and maintaining the core functions. It may be a question of time; education moves slowly, and now that there is a level of stability with the LMS, more experimentation can happen around the fringes.

In summary, the LMS provided a useful means of rapidly developing and unifying e-learning delivery which led to increased uptake of digital education. Much of open education relies on the type of stable platforms provided by the LMS, for example providing OER in formats which can be easily deployed within standard LMS. However, this has sometimes come at the price of a lack of innovation in digital education, and by extension open education.

## **Blogs**

Blogging developed alongside more education-specific developments, and it was then co-opted into ed. tech. In so doing, it foreshadowed much of the Web 2.0 developments, with which it is often bundled. Blogging was a very obvious extension of the web. Once people realized that anyone could publish on the web, they

inevitably started to publish diaries, journals, and regularly updated resources. Blogging emerged from a simple version of online journals when syndication became easy to implement. The advent of feeds, and particularly the universal standard RSS (Really Simple Syndication), provided a means for readers to subscribe to anyone's blog and receive regular updates. This was as revolutionary as the liberation that web publishing initially provided. If the web made everyone a publisher, then RSS made everyone a distributor.

People swiftly moved beyond journals and in education the ability to create content freely, and have it immediately distributed to a specific audience offered potential teaching opportunities. The use of blogs in education began in the early 2000s and a fledgling community of educational bloggers emerged. This potential to expand the academic community through the informal use of blogs that were external to formal university systems was powerful and would be repeated later with social media. From the perspective of today, with ubiquitous social media, it is difficult to appreciate how liberating the advent of blogging was in higher education.

Blogging provided a new form of academic identity, and one that increasingly became as significant as the traditional identity that is formed through publications, teaching, and research grants. It came with its own cultural norms of informality, acknowledgment, experimentation, and support. This was known to produce tension. For instance, Costa (2013) has argued that "Higher Education Institutions are more likely to encourage conventional forms of publication than innovative approaches to research communication" (p. 171). The online academic has had to negotiate two worlds simultaneously, which can have different modes of operation and value systems, as Costa (2016) put it, they end up being double gamers. There is some effort to reconcile these modes with increasing recognition of the value of network identity in achieving scholarly goals, although most remuneration is still linked to traditional outputs, such as published articles and successful research grant income. This is in contrast with the online world that determines prestige through identities and attention (Stewart, 2015).

Blogs can be seen as the start of what would become a networked academic identity, which would become more prevalent with the Web 2.0 and social media boom. Veletsianos and Kimmons (2012) used the term Networked Participatory Scholarship (NPS) to encompass scholars' use of social networks to "pursue, share, reflect upon, critique, improve, validate, and further their scholarship" (p. 766). This has become a rich area for research as academics wrestle with some of the issues it raises. On the positive side, Stewart (2016) noted that establishing such an identity increases visibility for pre-tenure academics, and this can offer some protection in a climate of precarious academic labor: "Among the junior scholars and graduate students in the study, opportunities including media appearances, plenary addresses, and even academic positions were credited to long-term NPS investment and residency, and to resultant online visibility" (p. 76).

However, on the negative side, the online world is one which Stewart (2016) notes can be characterized by "rampant misogyny, racism, and harassment" (p. 62). For all their potential to democratize the online space, such tools frequently reflect

and reinforce existing prestige, with higher-ranked universities having more popular Twitter accounts (Jordan, 2017a), and professors generally developing larger networks than other positions in higher education (Jordan, 2017b).

Increasingly, as data capitalism and the nefarious uses of our data have come to light, there has been a movement to “own your own domain,” with a blog at the center. That is, to host your own tools on a web domain that is under your control, rather than simply using a third-party service. Watters (2016) has emphasized that this control and ownership of data is an educational imperative:

When one controls—albeit temporarily—a domain name and a bit of server space, I contend, we act in resistance to an Internet culture and an Internet technology and an Internet business model in which we control little to nothing. We own little to nothing. (para. 04)

Blogs are not just a tool for educators, but increasingly for students also. It is interesting to speculate what the current digital education environment would look like if, in the early days, institutions had adopted blogging platforms as their LMS rather than the commercial products. This is not as far-fetched as it might seem – blogging tools such as WordPress can be constructed to deliver course content and have embedded discussions, and they are easily extendable with plug-ins for specific functions, resembling the sort of service-oriented architecture that was deemed desirable. Templated versions can be implemented for all students, so they have their own space to develop their identity, create assignments, and develop something akin to an e-portfolio (more on this later). In 2008, Jim Groom (2008) and others were promoting the idea of blogs as educational platforms:

This model puts the power in the hands of the authors, which in turn provides the possibility for a far greater level of educational openness. These are platforms that provide many, if not all, of the features of more traditional LMSs, but exponentially move beyond them given the fact that they benefit from huge open source communities that are constantly enhancing the applications. (Groom, 2008, para. 01)

What this comparison between the LMS and blogs reveals is more than a difference over software preferences; it reveals differing visions about the nature of digital education, with blogs more aligned to many of the characteristics of openness. For many of the advocates of blogs, the vision of ed-tech is one that embraces the open aspects of the original web. To return to Watters’ (2016) post on owning your own domain, she claims,

The *rest* of ed-tech—the LMS, adaptive learning software, predictive analytics, surveillance tech through and through—is built on an ideology of data extraction, outsourcing, and neoliberalism. But the Web—and here I mean the Web as an ideal, to be sure, and less the Web in reality—has a stake in *public* scholarship and *public* infrastructure. (para. 26)

Groom and Lamb (2014) also bemoan this loss of the original vision of the web in how educational technology came to be deployed, and see the LMS as a key component in this:

[h]igher education overall, perhaps concerned about the untamed territories of the open web and facing unquestionably profound challenges in extending its promise beyond the early adopters, cast its lot with a “system” that promised to “manage” this wild potential and peril. (p. 29)

It is not necessarily a binary divide. For instance, there are commercial applications of blogs and of the open-source LMS, so it is more of a continuum. It represents something of a philosophical divide about how people view e-learning, and at its center are degrees of control.

In summary, blogs can be seen as highlighting some of the tension that the previous two educational technologies have brought to the fore. The web provides almost uncontrolled freedom, which comes with issues and implications, while the LMS offers control which can be stifling. Blogs operate somewhere in the middle ground, which is perhaps why they are often a preferred tool for open practitioners such as Groom and Lamb.

## Social Media

If the LMS represents the dominant educational technology, then social media tools such as Twitter and WeChat represent the kind of third-party technology that has been adopted in education. Social media represents the culmination of the paradox that the web unleashed for education, and society in general, in that it is both a toxic, damaging environment that spreads disinformation, but also a useful tool for connecting, sharing and engaging.

Initially Twitter and other social media saw a democratizing effect: formal academic status was not significant since users were judged on the value of their contributions to the network. In educational terms, social media has done much to change the nature of the relationship between academics, students, and the institution. It remains a means of creating a valuable and rewarding network for scholars that brings real benefits. How, then, are we to resolve this quandary of benefit and damage? For some, the benefits are no longer significant enough and they have quit social media.

Educators, then, are faced with having to negotiate complex paradoxes for both themselves and often on behalf of their students. There are several potential uses for social media in teaching and learning, which can be framed as a set of hypotheses. These are not guaranteed findings, but rather potential impacts for which there are some tentative reasons to propose them.

- *Social media increases student recruitment.* The use of Twitter, Instagram, Facebook, and other social media by universities, students, and staff provides potential students with a good insight into student life and can act as an effective marketing tool (Constantinides & Zinck Stagno, 2011).
- *Social media increases student engagement.* The use of social media helps blur boundaries between study and other aspects of life and provides an element that

can be fitted in-between other activities in a way that more concentrated study activities cannot, and as such can improve student engagement (Roopchund, Ramesh, & Jaunky, 2019).

- *Social media increases student retention.* Students who make social connections tend to stay with their studies (Astleitner, 2000). Conventionally, this is realized through societies and social functions. Social media provides a further means to enhance these bonds, and particularly for distance or part-time students.
- *Higher education has a duty to develop expertise in fake news and misinformation.* Mike Caulfield (2017), who has done much of the work in exploring the impact of misinformation, has developed an online book and a wide range of activities to help develop these skills. They are likely to become increasingly significant as the quality of fake videos and sophisticated targeting improve.

Social media such as Facebook, Twitter, WeChat, and KakaoTalk have often achieved an infrastructure-like status for much of the online experience. For instance, for a significant number of users, Facebook is viewed as the entirety of the Internet. Reporting on surveys in Indonesia and Nigeria, Farrell (2015) stated that “large numbers of first-time adopters come online via Facebook’s proprietary network, rather than via the open web” (para. 08). While these corporations have inveigled their way to infrastructure status, we should remember that providers of physical infrastructure systems such as water, roads, and power have responsibilities and accountability placed upon them. This is relevant to online education, because it highlights the responsibility in mandating the use of such systems and thus increasing their infrastructure-like status and stresses the importance of developing a critical approach to technology in all subject areas.

What social media ultimately provides online education with is a set of tools and possibilities, but these are not without risks and issues. The clearer distinction between professional and personal is deliberately blurred on social media. This can be beneficial, but it also leads to “context collapse.” Marwick and Boyd (2011) highlighted this issue:

We present ourselves differently based on who we are talking to and where the conversation takes place—social contexts like a job interview, trivia night at a bar, or dinner with a partner differ in their norms and expectations . . . . The need for variable self-presentation is complicated by increasingly mainstream social media technologies that collapse multiple contexts and bring together commonly distinct audiences. (p. 01)

In other words, we communicate in social media with one audience in mind, but several different audiences might access that content. This context collapse provides both an opportunity, for example in reaching new audiences for research dissemination, and a risk, for example trolls searching for terms to harass people. This is a reflection of what social media does for education as a whole – the context between the university and the rest of society is collapsed. That may be beneficial generally,

but when it means conspiracy theorists arrive in a geology discussion to insist the world is flat, it raises problems that we are still incapable of solving.

In summary, social media provides a means of disseminating knowledge and a medium through which much of open practice can flourish. However, it also represents the more extreme aspects of the freedoms that the web originally provided and as such its usage in digital education is complex.

## MOOCs

The MOOC phenomenon is an interesting case study in the rise of digital education, particularly how it relates to open education. Such was their growth and hype during 2012 that *The New York Times* declared it to be “the year of the MOOC” (Pappano, 2012). MOOCs can be viewed as the combination of several preceding technologies: some of the open approach of OER, the application of video, and the revolutionary hype of Web 2.0. Early experiments by educators such as George Siemens and Stephen Downes with course design had examined connected pedagogies. These had attracted attention within the online education community, but MOOCs were still widely unknown outside of the field. However, once Stanford professor Sebastian Thrun’s course on artificial intelligence attracted over 100,000 learners and almost as many headlines (Raith, 2011), they gained media interest and significant venture capital. Now that the initial flurry of activity has died down, what can we say about MOOCs?

First of all, their impact has been far less dramatic than was often projected at the start. Sebastian Thrun famously declared that there will only be 10 global providers of higher education by 2022 (Leckart, 2012), and that was not the case. Morgan (2016) argued that “MOOCs prove that universities can and should embrace online learning,” and Godin (2016) proclaimed MOOCs to be the “first generation of online learning.” As well as overclaiming for the impact of MOOCs, what many of these pieces have in common is a conflation of online learning with MOOCs. For instance, it didn’t take the development of MOOCs to show universities that they should embrace online learning, as Morgan contended.

A consequence of this conflation is that, if MOOCs and the online courses are synonymous, then MOOCs become seen as the *only* way of realizing online learning. For example, Lewin (2013) published his article entitled “After Setbacks, Online Courses Are Rethought” in *The New York Times* on the problems of Thrun’s company, Udacity, and its approach to MOOCs. In this narrative, MOOC failures become the failure of all online learning, and the future of MOOCs becomes the future of all online learning.

Several problems began to emerge with MOOCs after the initial enthusiasm, leading to the reining back on some of the ambitions. The key ones were:

- Low Completion Rate – With around only 10% of registered students finishing the course, completion rates have been problematic for MOOCs (Jordan, 2014).

- Learner Demographics – Most successful MOOC learners were already well educated (Christensen et al., 2013), and this finding undermined claims of the MOOC democratizing learning.
- Sustainability – As MOOCs became industrialized and required high-quality media outputs, their costs varied considerably, particularly when staff time, marketing, and support were factored in (Hollands & Tirthali, 2014). Finding sustainable business models that justified this expenditure has proven problematic.

These issues saw a change in tone around MOOCs, with MOOC provider Coursera (2013) announcing that it was going to “explore MOOC based learning on campus.” This proposed system resembled conventional blended learning, or e-learning, but on a new platform. Similarly, Georgia Tech announced it was offering a masters-level MOOC, which was not free (costing US\$7,000), once again conflating online learning with MOOCs, and Thrun’s company Udacity “pivoted” to focus on corporate training.

Aside from all the hyperbole, what practical applications of MOOCs have emerged? The most obvious one is that millions of people signed up for them and found them an enjoyable and useful learning experience. For example, Farrow, Ward, Klekociuk, and Vickers (2017) reported on over 11,000 participants in a MOOC on understanding dementia. As educators, the rise of such courses and increased knowledge has to be seen as a positive outcome. There are also examples of their use in formal education to expand the curriculum; for example, the Delft University of Technology offers a “Virtual Exchange Programme,” whereby its campus-based students can take MOOC with other accredited providers and receive credit at Delft (Pickard, 2018). Other providers offer routes by which learners’ gain credit for studying in MOOCs and transfer these into a university to count toward a degree. While such models will not appeal to everyone, they do allow increased flexibility in the higher education offering. The more recent interest in “micro-credentials,” i.e., shorter courses that carry university credit can also be seen as a consequence of the MOOC approach.

MOOCs also raised the profile of online education, and open practice in particular. Even if MOOCs themselves are only open in terms of enrolment and not in terms of licensing, their presence has a knock-on effect. For example, for many university libraries, curating their open access resources is not a priority because fee-paying students have access to those resources anyway. So, there is no real driver for educators to focus on open access above other resources. But when universities started creating MOOC, this placed pressure on people to use open access resources, because the open learners probably wouldn’t have privileged library access. While we may bemoan that MOOCs themselves are not really open in the sense of openly licensed, they do form part of a larger system, which helps drive openness.

In summary, MOOCs might seem to represent one of the successful alignments of digital and open education. However, many proponents of open education would not consider them truly open, and their commercial drivers have often pushed them toward increasingly conventional models of education.

---

## Conclusions

In this chapter, five significant technologies for digital education have been considered, namely, the web, LMS, blogs, social media and MOOCs. Many other educational technologies could have been addressed also, for example wikis, computer games, mobile technology, learning analytics, and virtual reality. These have all raised the profile and range of possibilities for digital education. In this concluding section analysis can turn to what they represent collectively for open education in particular. The five technologies highlighted here have a number of features in common. First, they lowered the participation barrier, making it easier for educators and students to engage in digital education. The web, social media and blogs all made publishing and sharing a democratized activity. This meant that not only could educators experiment, but that learners were operating in a context where online activity was increasingly the norm. Digital education therefore is not struggling as an unfamiliar concept. Second, they all have elements of control as a central proposition. For the web and social media there is a lessening of control, while the LMS is a means to explicitly regain that control from the “wild web.” MOOCs are an interesting microcosm of this tension, as the early experimental MOOCs (sometimes referred to as cMOOCs) were much more open in terms of pedagogy, community and technology. The later commercial MOOCs (also known as xMOOCs) are delivered in a much more uniform, linear, controlled manner. Lastly, the combination of these two features – ease of use and control – lead to reflections on openness.

At the start of this chapter eight areas of open education were proposed. The five educational technologies presented here map much of this trajectory. The web was crucial in the transformation of much of distance learning into e-learning, which led to the LMS. Blogs and social media have informed open practice, which was a driving factor for OER and MOOCs. It is a mistake to see open education as synonymous with only one of these eight sub-topics, just as it is also not synonymous with digital education. However digital education and open education are intricately entwined. Digital technologies give rise to development in education which seeks to explore aspects of the openness these technologies afford. The practices developed in open education themselves then go on to influence the development of further technologies. It is through this lens of iterative influence that we can best consider future developments in open education.

## Abstract

This chapter traces the ethical issues around applying artificial intelligence (AI) in education from the early days of artificial intelligence in education in the 1970s to the current state of this field, including the increasing sophistication of the system interfaces and the rise in data use and misuse. While in the early days most tools were largely learner-facing, now there are tools that are teacher-facing, supporting their management of the classroom, and administrator-facing, assisting in their management of cohorts of students. Learner-facing tools now take into account the affective and motivational aspects of learning as well as the cognitive. The rise of data collection and its associated analytic tools has enabled the development of

dashboards for the dynamic management and reflective understanding of learners, teachers, and administrators. Ethical issues hardly figured in the early days of the field but now they loom large. This is because of the legitimate fears that learners' and teachers' autonomy will be compromised, that learner data will be collected and potentially misappropriated for other purposes, and that AI will introduce extra biases into educational decisions and increase existing inequity and also because of the scary reputation that AI has in general.

**Introduction**

Artificial intelligence (AI) was initially applied in education about 50 years ago and only a decade or so after the founding of AI as a research field itself, at a Dartmouth College Workshop, in Hanover, New Hampshire, USA, in 1956 (see, for example, Moor, 2006).

In 1970, Carbonell's paper "AI in CAI: An Artificial-Intelligence Approach to Computer-Assisted Instruction" described a tutor and authoring system named SCHOLAR for geography, based on semantic networks (Carbonell, 1970). This "information structure-oriented (ISO)" tutor separated out its teaching strategy from its knowledge of South American geography in such a way that, in principle, the geography of some other part of the world could be slotted in and the teaching strategy applied to that, or a different teaching strategy applied to the geography of South America. Moreover, because of the explicit representation of its geographic knowledge via semantic networks, the system could reason about its knowledge to draw conclusions that were not explicitly coded in and also answer questions about what it knew. Thus, its "mixed-initiative" teaching strategy could encompass both the system questioning the student, making use of the context and the relevance of its questions, and the student questioning the system, both in very limited English. The system kept track of which bits of the geographical domain had been understood by the student by tagging the relevant parts of the semantic network, thus creating an evolving model of the student's knowledge. This adaptation to the individual learner was one of the factors that distinguished this system from the computer-assisted instructional (CAI) systems that preceded it. The system also exemplified what came to be the standard conceptual architecture of learner-facing artificial intelligence in education (AIED) systems.

**The Early Days of AI in Education**

An early collection of AIED papers demonstrated what could already be achieved about a decade later (Sleeman & Brown, 1979). This collection included articles,

among others, on systems for computer-based coaching in a gaming scenario (Burton & Brown, 1979), adding tutorial rules to an expert system to enable it to explain and teach the expert system's rules (Clancey, 1979), a knowledge representation to capture the evolving understanding of a learner (Goldstein, 1979), a tutor for elementary programming (Miller, 1979), and a tutoring system for quadratic equations that conducted experiments to evaluate its own teaching performance and then update its own teaching tactics as a result (O'Shea, 1979).

These early papers essentially mapped the conceptual architecture of what are now often called "learner-facing tools," namely, an explicit model of what is to be taught, an explicit model of how it should be taught, an evolving model of the learner's understanding and skill, and an interface through which the interaction of the learner and the system communicate. Hartley (1973) provided an early definition of this architecture as follows, where (3) and (4) together are the explicit model of teaching, and the interface was not mentioned given its limited scope at that time:

1. A representation of the task
2. A representation of the student and his performance
3. A vocabulary of (teaching) operations
4. A pay-off matrix or set of means-ends guidance rules (Hartley, 1973, p. 424)

The standalone nature of these early systems, their unsophisticated interfaces, and their lack of interest in collecting large amounts of learner data meant that many of the contemporary ethical issues around the use of AIEd were not in evidence.

From the start, the general field of AI has had intertwined scientific and engineering aspects (Buchanan, 1988). The scientific aspect of AI *in education* has concerned itself with questions around the nature of human learning and teaching, often with the goal of understanding and then duplicating human expert teaching performance. This aspect has focused largely on learner-facing tools but more recently has expanded into teacher-facing tools. The science has been pursued as a kind of computational psychology for its own sake or as a way to improve educational practice and opportunity in the world. The engineering aspect of applying AIEd has exploited a wide range of computational technologies such as Carbonell's semantic networks, mentioned above, and more recently machine learning techniques of various kinds. This aspect of the work has pursued even wider goals that also include the development of educational administrator-facing tools.

This chapter is divided into six sections. Section "[Contemporary AI in Education](#)" gives a brief overview of the current state of the applications of AIEd, including subsections on learner-facing tools, teacher-facing tools, and administrator-facing tools. Section "[Ethical Issues](#)" examines the ethical issues that arise from applying AIEd, including the ethical issues around educational technology in general, ethical design, and the ethical use and analysis of data. Section "[Open Questions and Directions for Future Research](#)" looks at open questions. Section "[Implications for Open, Distance, and Digital Education \(ODDE\)](#)" examines the implications for open, distance, and digital education (ODDE). Section "[Conclusion](#)" offers some brief conclusions.

## Contemporary AI in Education

These days the field of AIEd has split into three broad overlapping enterprises. The first continues to develop educational tools that focus on *learners* by undertaking various pedagogical roles such as tutoring a set of skills (Koedinger & Alevan, 2016) or assisting concept acquisition (Biswas, Segedy, & Bunchongchit, 2016) or supporting metacognitive awareness and regulation (Azevedo & Alevan, 2013), among others. The second enterprise is the development of assistive tools for teachers (see section “[AI and Teacher-Facing Tools](#)”), and the third enterprise develops tools designed to help educational administrators (see section “[AI and Administrator-Facing Tools](#)”). A useful summary of the applications of AIEd for a reader working within ODDE can be found in Kose and Koc (2015).

### AI and Learner-Facing Tools

As an example of a tool that focuses on learners, Betty’s Brain is a system designed to help students develop their understanding of the concepts of ecology (Biswas et al., 2016). In this system, the interface is one of the key parts of the system. The student uses the interface to draw a conceptual map consisting of nodes and arrows depicting some of the processes involved in a river ecosystem, such as the absorption of oxygen and the generation of carbon dioxide. The system also provides reading materials from which the student is expected to create the conceptual map. At any time, the student can ask the system to check and test her conceptual map for accuracy and completeness, and the system will offer comments to help her build a better conceptual map. The system is presented in terms of a story where the student is building a conceptual map for an artificial student, Betty, hence Betty’s Brain. The checking and testing is presented as if being set and marked by an artificial teacher, Mr. Davis. Mr. Davis also provides metacognitive hints to the student if she seems to not be paying proper attention to her own learning, such as not making good use of the available reading material.

One of the developments of AIEd since the early days has been the focus on learners as human beings with *feelings* and *aspirations* as well as knowledge and skills. This broader focus on the nature of learners and learning has been provoked by our increased understanding of learner motivation (Schunk, Pintrich, & Meece, 2008), mindset (Dweck, 2002), and academic feelings/emotions (Pekrun, 2014), to name but three aspects of human learning. While such an evolution helps to humanize the interaction between systems and learners, it opens up further scope for ethical issues around privacy and around the kinds of data that are collected and stored. This enlarged focus has involved the development of techniques to try to assess the transient emotional and motivational states of learners in order to boost positive frames of mind, such as engaged concentration, and counter negative states of mind, such as frustration or boredom.

An example of the application of the above is found in a tutor for school mathematics. Arroyo et al. (2014) drew on the work of Dweck (2002) and others

to augment an existing tutoring system for mathematics by clustering students' learning behaviors into a small number of profiles in terms of their use of hints, the time they were taking in solving problems, and the number of errors they were making. Each of these profiles was determined by both cognitive and affective/motivational dimensions. For each profile, there were cognitive and affective/motivational actions and feedback by the tutor, such as to set a harder problem (cognitive), praise effort or to de-emphasize the importance of immediate success (affective/motivational).

The suite of language learning tools, Enskill, provides another example of a contemporary interface for learner-facing systems (Johnson, 2019). This is a suite of tools for learning a language, the contextualized use of the correct language register, and for learning how to speak effectively, e.g., making a forceful case for some course of action. The tools use game-based technology to set up an on-screen scenario containing one or more characters with whom the learner speaks and who can reply in speech. The analysis and feedback of the learner's language can be at different levels depending on the context, e.g., pronunciation, grammar, and appropriateness. Moreover, the tools log all interactions with learners, and these link into a mechanism to improve the systems' performance when mistakes or glitches occur ("data-driven development (D3) of learning environments").

A particular outcome of learner analytic aspect of AI in education has been the growth of "dashboards" (Schwendimann et al., 2017). These can be aimed at students to help them reflect on progress, either in the moment or after a lesson or session, or even reflect on the efficacy of the reflection tools themselves (Jivet, Wong, Scheffel, Specht, & Drachler, 2021). Dashboards aimed at students have grown out of an earlier learner-facing technology named "Open Learner Models" (see, for example, Bull & Kay, 2016).

## Are Learner-Facing Tools Effective and Being Used?

There have been at least seven meta-studies and meta-analyses of the effectiveness of learner-facing tools as compared to either a teacher working with a whole class of students or a skilled teacher working with a single student (for a summary, see du Boulay, 2016). The overall message from 182 comparative studies is that learner-facing tools perform better in terms of learning gains compared to a human teacher working with a whole class (effect size = 0.47) but slightly worse than a skilled human tutor working with a single student (effect size = -0.19). In addition to the seven meta-studies, there was a 2-year, large, multistate evaluation of the Cognitive Tutor for Algebra in matched pairs of schools in the USA (Pane, Griffin, McCaffrey, & Karam, 2014). Each pair consisted of a school that continued to teach algebra in their own fashion and another in which the school also made use of the Cognitive Tutor for Algebra (though without necessarily using it as per the advice of the tutoring system's designers). In the second year of the study, when the teachers had got used to deploying the tutoring system effectively, there was a small comparative learning gain in favor of the schools using the tutoring system (effect size = 0.21).

Despite the positive results for learner-facing tools above, the penetration of artificial intelligence tools of all kinds into schools and colleges has been slow, but with some notable exceptions, such as the Cognitive Tutors in the USA, mentioned above, and now trading under the name Carnegie Learning (Koedinger & Aleven, 2016). More positively, Baker, Smith, and Anissa (2019) say:

Despite minimal attention, AIED tools are already being used in schools and colleges in the UK and around the world – today.

We find learner-facing tools, such as adaptive learning platforms that ‘personalise’ content based on a child’s strengths and weaknesses. We find teacher-facing tools, such as those which automate marking and administration (one government-backed pilot in China sees children in around 60,000 schools having their homework marked by a computer). We find system-facing tools, such as those which analyse data from across multiple schools and colleges to predict which are likely to perform less well in inspections. (p. 5)

According to a systematic review of research on artificial intelligence applications in higher education, the penetration into universities is still patchy with few papers referring either to the ethical dimensions or to learning theory (Zawacki-Richter, Marín, Bond, & Gouverneur, 2019):

The descriptive results show that most of the disciplines involved in AIED papers come from Computer Science and STEM, and that quantitative methods were the most frequently used in empirical studies. The synthesis of results presents four areas of AIED applications in academic support services, and institutional and administrative services: 1. profiling and prediction, 2. assessment and evaluation, 3. adaptive systems and personalisation, and 4. intelligent tutoring systems. The conclusions reflect on the almost lack of critical reflection of challenges and risks of AIED, the weak connection to theoretical pedagogical perspectives, and the need for further exploration of ethical and educational approaches in the application of AIED in higher education. (Zawacki-Richter et al., 2019)

In their editorial to a special issue on AI in university education, that included the paper mentioned above, the editors noted that “there is little evidence at the moment of a major breakthrough in the application of ‘modern’ AI specifically to teaching and learning, in higher education, with the exception of perhaps learning analytics” (Bates, Cobo, Mariño, & Wheeler, 2020).

## AI and Teacher-Facing Tools

Recently, there has been the development of educational tools that focus on teachers to help them either *orchestrate* the use of classroom technology or reflect on that organization. They also (i) help teachers allocate their precious time effectively to those students who need it most and (ii) analyze students’ work to determine which are the common issues within a class. We can see this as an evolution of the learner model to encompass both the individuals within a group and the group itself.

For example, the Lumilo system gave the teacher glasses that provided an augmented reality view of her class of students, each working alone with an AIED

system (Holstein, McLaren, & Alevan, 2018). There were two kinds of augmentation in this view. The first involved an augmented reality symbol, apparently hovering above each student's head, that indicated their current learning state. These symbols included those for designating the following learner states: idle, (too) rapid attempts, hint abuse or gaming the system, high local error after hints, or unproductive persistence. These symbols were designed to give the teacher information on which to base her decision about which student she should go and help in person. The second augmentation involved an analysis of how the students were doing as a whole to provide a synopsis of problems common to the class. This synopsis was designed to give the teacher information on what might be the focus of her whole class interventions.

## AI and Administrator-Facing Tools

The third broad area for AIEd has been the rise of analytics applied to data generated in educational contexts at the class or cohort level and aimed at administrator-facing tools. These kinds of analysis explore, for example, the relation of learner engagement to overall success in massive online open courses (MOOCs) (see, for example, Rienties et al., 2016), different patterns of engagement (see, for example, Rizvi, Rienties, Rogaten, & Kizilcec, 2020), and identification of individual and whole class difficulties with course material and the means to rapidly identify and fix any problems and failings in the interactions of a systems with its learners (see, for example, Johnson, 2019).

For example, Peach, Yaliraki, Lefevre, and Barahona (2019) analyzed learners' temporal behavior in online courses at Imperial College Business School and the UK Open University. This data included task completion, timing, and regularity of interactions with the learning system. They mapped individuals' task completion times against the average for all learners and used clustering techniques to create groups that included early birds, on time, low engagers, sporadic outliers, and crammers. They found that poor performers (based on outcome measures) typically evidenced cramming behavior (no surprise there) but good performers were found in all of the time-related groupings, including low engagers and crammers.

In their wide-ranging systematic review, Zawacki-Richter et al. (2019) found a number of papers related to the application of AI in admissions decisions. For example, Acikkar and Akay (2009) used machine learning techniques to generate a predictive model of whether students would be admitted to university to study physical education and sports based on their "performance in the physical ability test as well as [their] scores in the National Selection and Placement Examination and graduation grade point average (GPA) at high school" (p. 7228). These analyses were undertaken retrospectively and were very accurate (e.g., >90%). The ethical dimension of such predictions comes into sharp focus if such predications are made prospectively when students apply, either as advice to admission tutors or more worryingly as actual decisions with no human in the loop.

## Ethical Issues

There have been fears about artificial intelligence from long before the advent of the field (see, for example, *The Golem* (Meyrink, 1915) – a retelling of an ancient tale about animating a living being from a clay statue). However, there were few ethical issues uppermost in the minds of the early creators of student-facing tools using AI. For them, the issues were largely technological and pedagogical, e.g., how to build such systems at all and to determine whether they were effective in educational contexts. These days ethical issues have become much more pressing because of the greater penetration of educational technology (including AI-based technology) into education and training at all levels, the much greater collection of data in educational contexts, and the entry of companies engaged in surveillance capitalism into the educational ecosystem (Williamson, 2018).

### Ethical Issues Around Education in General

In most countries, human teachers already operate within an ethical framework. In Scotland, for example, this covers a number of areas, including *doing one's best* for one's students, e.g., by keeping up to date with changes in the curriculum, and *treating students equitably*. It also includes respecting students' confidentiality (see, for example, General Teaching Council Scotland, 2012).

The rise of educational technology of all kinds, whether involving AI or not, and its creation of logs of interactions, has produced a huge amount of student data at all levels in education from primary (elementary) schools to universities. Teachers' ethical guidelines, such as those above, need to encompass these extra sources of data. There are many unanswered questions about who owns this data, who has access to it, how long it will be kept, and so on. The European Framework on General Data Protection Regulation (GDPR) provides guidance on managing all kinds of personal data (Li, Yu, & He, 2019). However, there are still issues for students around understanding what data about them counts as "personal" (Marković, Debeljak, & Kadoić, 2019), as well as around their degree of ownership and rights over educational log data.

### Ethical Issues of AI in Education

Involving AI into educational technology must also be required to *do its best and treat students equitably*. For learner-facing tools, one should expect that designers of the educational technology will ensure that the technology will do the best that is possible in the circumstances, whether it is teaching, tutoring, mentoring, or counseling students. One should also expect that the technology treats students in an equitable fashion and does not favor one student over another either inadvertently or deliberately.

### **Learner-Facing Tools**

How might it ever be the case that technology treats students inequitably, we may ask? Many learner-facing systems select what they think is the next most useful learning task, e.g., the next problem to solve, for a particular student with a particular educational history. A faulty design-level categorization of learners into groups, e.g., by gender, perceived prior attainment, motivation, or self-regulated learning capability, might lead to a student being presented with inappropriate or much tougher tasks than they can cope with or indeed much easier tasks than they can learn from. Of course, this kind of bias can also happen with human teachers where their low expectations of some students can become self-fulfilling prophecies. But just because human teachers can, on occasion, be biased does not mean we should turn a blind eye to the potential biases in AI-based educational technology.

### **Teacher-Facing Tools**

Similar considerations apply to teacher-facing tools. The Lumilo orchestration system we described above flagged up students who were doing OK or who were experiencing different kinds of difficulty. This aimed to enable the teacher to make choices about who to help. Clearly, this is an ethically charged decision. Should the teacher prioritize those who are in most difficulty or spread her effort more evenly across the whole class? That is a human dilemma. But the orchestration system had better get its diagnostics correct about who it thinks is doing OK and who it thinks needs help. Even without the use of AI, systems for helping the teacher manage a classroom can have unexpected negative effects on the students. In a study of ClassDojo, used by teachers to record student behaviors, Lu, Marcu, Ackerman, and Dillahunt (2021) noted that:

In particular, the use of ClassDojo runs the risk of measuring, codifying, and simplifying the nuanced psycho-social factors that drive children's behavior and performance, thereby serving as a "Band-Aid" for deeper issues. We discuss how this process could perpetuate existing inequality and bias in education. (Lu et al., 2021)

### **Administrator-Facing Tools**

For a discussion of the wide uses of AI in universities, see Zeide (2019). Administrator-facing tools are sometimes used to make predictions about which students seem to be doing broadly OK and which are showing evidence of failing the course or dropping out. These kinds of judgment are often based on learning analytics using AI methodologies. The issue here is the consequences of false negatives and false positives emerging from an inadequate data analysis. For example, missing signs that a student is really struggling may mean that no human is alerted to provide help. Labeling a student as struggling who is doing OK may also have repercussion down the line, rather like an incorrect entry in a credit rating. For an interesting example of the artifacts that can occur in analyzing cohort data, see Alexandron, Yoo, Ruipérez-Valiente, Lee, and Pritchard (2019). They showed that sometimes students using a MOOC set up two accounts so that they could game the system. One account (in a fake name) would be used to get lots of help from the

system to find the right answers, while the other account (in the student's real name) would be used to answer all the questions quickly and correctly.

Using predictions to drive admissions of students to schools or colleges (Acikkar & Akay, 2009) or to predict grades when exams could not be taken because of COVID are fraught with ethical issues. The recent creation and then abandonment of an algorithm to predict UK student grades for entry to university is a salutary reminder about both potential AI biases and the potential human teacher biases the algorithm was intended to mitigate (see, for example, Hao, 2020).

## **Dealing with Ethical Issues in the Design, Implementation, and Deployment of AIED Systems**

Many different systems are now designed that include AI elements, from smartphone apps to big bank data systems. There has been increasing concern about the ethical questions that arise in the design, implementation, and deployment of such systems, with the EU proposing legislation to manage the situation (European Commission, 2020). Many different frameworks have been proposed to manage the development of such systems. A useful summary of such frameworks can be found in Floridi and Cows (2019). They developed a framework from bioethics, under the general headings of beneficence, non-maleficence, autonomy, and justice, to also include "explicability." Most systems should work under the control of (or at least in tandem with) humans, so it is important that the system employing AI is able to offer an explanation or justification for exactly why it is suggesting a decision, a course of action, an outcome, or whatever, in order that the human can weigh up the degree to which he or she should agree with the machine. Particularly in education, autonomy and explicability must play a central role.

The issue of collecting, analyzing, and managing learner data has become more pressing for many reasons, including (i) greater general awareness of data privacy issues, (ii) the sheer quantity of learner data being collected, (iii) the increased use of AI and other methodologies for finding patterns in that data and drawing inferences from them, and (iv) the use of learner (and thus user) data for commercial purposes which have nothing to do with education (Williamson, 2018).

For example, Williamson (2018) warns about "Big Tech" companies moving into the field of education, typically with learner-facing tools, so that they can harvest the learner data for commercial purposes:

Startup schools are analysed as prototype educational institutions that originate in the culture, discourse and ideals of Silicon Valley venture capital and startup culture, and that are intended to relocate its practices to the whole social, technical, political and economic infrastructure of schooling. These new schools are being designed as scalable technical platforms; funded by commercial "venture philanthropy" sources; and staffed and managed by executives and engineers from some of Silicon Valley's most successful startups and web companies. Together, they constitute a powerful shared "algorithmic imaginary" that seeks to "disrupt" public schooling through the technocratic expertise of Silicon Valley venture philanthropists. (Williamson, 2018, p. 218)

Researchers within AI in education are starting to be aware of these ethical issues, even though Zawacki-Richter et al. (2019) found only two papers in their systematic review of the applications of AI in universities that dealt with ethical issues. So, for example, we see both the emergence of general design frameworks, such as that of Floridi and Cowls (2019) above, for including AI in software products, and those aimed specifically at the development of AI applications in education (see, for example, Drachsler & Greller, 2016) and, most notably, the creation of an Institute of Ethical AI in Education which has set out guidelines particularly for teachers in their use of applications of AI (Seldon, Lakhani, & Luckin, 2021).

---

## Open Questions and Directions for Future Research

From an ethical point of view, the big issue is how we can ensure that learners acquire more control over the data that is generated when they interact with educational technology and are protected from the misuse of their data by others. This section identifies some open questions and directions of research in the science and engineering of applications of AIED for each of the categories of system mentioned above, namely, learner-facing, teacher-facing, and administrator-facing.

Given the increasing interest in gathering and using affective data about learners to improve the adaptivity of learner-facing tools, two *scientific* questions are (i) what might be the most useful affective categories on which to develop an affective pedagogy and (ii) what kinds of pedagogic rules should be used to maximize the chance of fruitful learning, given the sequence of the learner's cognitive and affective states so far. For example, should hope, dismay, and pride also play a role as well as confusion, frustration, and engaged concentration, and how should they be "managed"?

For systems aimed at teachers, an *engineering* question is: How best to manage and support the division of labor between the human teacher(s) and the system, given the manifest complexity and dynamic nature of most classrooms full of learners? For example, how should a tool used for dynamic management differ from one used for reflective practice?

For systems aimed at understanding cohorts, an *engineering* question is: How best can learning management systems be developed to measure and potentially answer *academic* questions about learning rather than *administrative* ones? For example, did students on this course show strong evidence of improvements in their self-regulated learning capability?

---

## Implications for Open, Distance, and Digital Education (ODDE)

There are three main implications for ODDE. The first is that one of the oldest technologies for distance learning, the textbook, has been enhanced by the application of AI, either through adapting the content or the route through that content to the reader (see, for example, Thaker, Huang, Brusilovsky, & He, 2018). The second

implication is that online, distance, and digital systems have increasingly incorporated elements of AI in order to make such systems smarter and more responsive to the needs of learners and teachers (see, for example, Kose, 2015; UNESCO, 2021). The third implication is that the developers and deployers of ODDE systems are already taking an ethical stance on how the systems are designed and built, how they are used in practice, and how their data is collected, stored, and analyzed (Prinsloo & Slade, 2016). For example, with particular respect to ODDE, Sharma, Kawachi, and Bozkurt (2019) state:

First, there should be some control mechanisms that should be put into place to ensure transparency in collection, use and dissemination of the AI data. Second, we need to develop ethical codes and standards proactively so that we truly benefit from AI in education without harming anything; not only humans but any entity. Third, we should ensure learners' privacy and protect them for any potential harm. Next, we must raise awareness about the AI so that individuals can protect themselves and take a critical position when needed. (p. 2)

---

## Conclusion

In order to give a longitudinal view of AIEd and ethics, this chapter has sketched the early days of learner-facing system development in the 1970s as well as provided some examples of much more recent systems. While the early systems were mostly learner-facing, contemporary applications of AI now also include teacher-facing and administrator-facing tools and are used both locally and via online, distance, and digital technologies.

The interface is one area where there have been big changes. One of the earliest systems had an interface that involved the learner typing in answers (and indeed questions) in stilted English, whereas contemporary learner-facing tools can show lifelike pedagogical agents with whom learners have a spoken dialogue in everyday English. Moreover, tools for other kinds of user make use of complex interactive dashboards.

In the early days, learner-facing tools were largely designed to work as tutors with a single learner. These days some tools are still designed to work with a single learner, though they can now adapt to the learner's affective and motivational state as well as to what the learner knows and understands. Other tools can work with more than a single learner (see, for example, Walker, Rummel, & Koedinger, 2009), and others again work with teachers rather than learners to assist them in the complex task of managing a class full of students and allocating their limited time in the most effective way.

The creation of log data from educational systems and the use of data mining and other analytic techniques have given rise to the thriving field of learner analytics. This in turn has enabled the creation of dashboards for learners, teachers, and administrators to interrogate data at varying levels of granularity.

Ethics has played a strong role in education for many years, most obviously via the codes of professional practice that teachers are expected to act within. In the

early days of AI, ethical issues around education tool design and deployment were not uppermost in the minds of designers: simply making the systems work effectively was the main goal. Nowadays, ethics is very much in people's minds whether they be system designers, teachers, parents, administrators, or indeed learners, but there is still a long way to go to make educational technology a place of trust and safety.

AI has a mixed reputation. On the one hand, it is so ubiquitous that we hardly notice it, e.g., interacting with a chatbot on a website or having one's camera optimize a photograph. On the other hand, there are scary stories about AI taking over the world, or just as scary reports about biased decisions that might affect one's well-being (e.g., refusal of a mortgage or a job) or one's life (e.g., a diagnostic system generating a false-positive or false-negative report about a tumor). Within education, there are issues about the ways that analytics may produce biased results or that companies using AI enter education not with learner's best interest at heart but as a way to Hoover up their data for commercial purposes. To counter these issues, various codes of ethics have been developed that cover all aspects of the design and deployment of AI-based educational technology at both international and more local levels.

**Acknowledgments** I thank Mutlu Cukurova, Carmel Kent and Anissa Moeini and the reviewers for helpful suggestions on a draft of this chapter.

### Abstract

This chapter explores the influence of three of distance education's classic theorists—Otto Peters, Börje Holmberg, and Michael Moore—on its subsequent conceptualization and practice. The classic theorists' understanding of theory and theorizing is discussed critically in the context of the articulation of each's particular theory. This is then contextualized in terms of the history of the

development of distance education and its institutions, from Pitman's correspondence courses on shorthand, through correspondence schooling and higher education external studies, to the rise of the United Kingdom Open University in the 1960s. The latter's subsequent powerful influence on the theory and practice of open and distance education internationally is described as stimulating a fertile context for the classic theorists' endeavors. Finally, consideration is given to more recent scholars' interpretations and adaptations of the classic theories of distance education. This leads to a concluding reflection on the authors' engagement with distance education theorizing and the prospects for the future of distance education's theorizing and practice.

**Introduction**

Three theorists—Otto Peters, Börje Holmberg, and Michael Moore—have fundamentally influenced the way that “distance education” came to be named, articulated, and practiced from the late 1970s. Their theorizing and leadership helped shape the rise of open and distance education globally through agencies, such as the International Council for Open and Distance Education (as it was (re)named in 1982), the Commonwealth of Learning (formed in 1988), and, more generally, through UNESCO. Their theoretical works are described below and then juxtaposed critically to elucidate the different nature of their theorizing of the field.

Consideration is given to the educational practices and institutions—correspondence education, external studies, the establishment of the UK Open University (OUUK), etc.—that preceded or overlapped with the three theorists' early work which provided the context for the emergence and naming of the new field of “distance education.” Furthermore, their work is discussed in relation to the consequences for (open and) distance education policy, practice, and scholarship as reflected in the writings of their more recent contemporaries. The chapter proceeds to a discussion of other scholars' interpretations and theorizing from these foundational theories of distance education to contribute to retheorizing distance education as its practices and potential unfold in the twenty-first century.

The chapter closes with the authors' reflections on their engagement with distance education theorizing, research, and practice which drew on the work of the classic theorists and others. This leads to a consideration of the future direction of distance education's theorizing and practice.

## Classic Theorists of Distance Education

In order to understand distance education, it is advantageous to examine its origins through a lens of its classical theories in a chronological order. Such an examination affords an understanding of the subsequent theoretical developments and the emergence of “new” theories, which build on, and advance, the preceding classical theories. We ascribe classic theories of distance education as those of Otto Peters (1973, 2003, 2007), Börje Holmberg (1983, 2003, 2005), and Michael Moore (1973, 1993, 1997) (a contributor to this volume). Their work was not only visionary for their times but also of fundamental importance to define distance education as a subdiscipline of education (Delling, 1971). In so doing, they set the concept of “distance education” apart from the theory and practice of correspondence studies, which emerged in the nineteenth century (Fritsch, 2001).

The rationale for defining the theoretical foundations developed by Peters, Holmberg, and Moore, respectively, as *classical distance education theories* is that each of these theories (i) has its specific epistemological grounding, (ii) is an independent epistemological construct, (iii) operationally defines distance education, (iv) has particular explanatory representations, and (v) has its own distinct identifiable descriptive constituents.

Based on the above rationale and in chronological order, Peters (1973) was arguably the first scholar who advanced a theory of distance education, namely, *distance education as an industrialized form of education*. The second major theoretical discourse on distance education was advanced by Holmberg with his *guided didactic conversation* theory (Holmberg, 1983). Subsequently, Moore (1993) developed the *transactional distance theory* which, alongside Peters and Holmberg’s work, can be categorized as a “classical” distance education theory.

Peters, Holmberg, and Moore with their respective theories based on different epistemological frameworks provided the foundations for distance education theories that followed. In so doing, they advanced significantly the scholarship of distance education. Thus, for scholars and practitioners of distance education, their theories are important for understanding the concept of “distance education” as it has mutated into its current forms.

Prior to dissecting classical distance education theories, it is useful to explain how each of the theorists defines “theory.” Peters, Holmberg, and Moore held their own particular understandings of what constitutes a theory; these contributed to each’s theoretical stances. Bernath & Vidal (2007, n.p.) cited Peters as defining “theory” as an “understanding of reality” and as “. . .an explanation, a systematic account of relationships among phenomena.” They noted that Peters referred to Garrison (2000, p. 3) stating that theory “. . .is a coherent and systematic ordering of ideas, concepts and models, with a purpose of constructing meaning to explain, to interpret, to shape practice.”

Pyari (2011, p. 95) described Holmberg as defining theory as being a “. . .systematic ordering of ideas about the phenomenon of a field of inquiry, and

an over-arching logical structure of reasoned suppositions which can generate testable hypotheses” (Bernath & Vidal, 2007). Holmberg did not offer a generic definition of theory but rather referred mainly to teaching-learning theories in a descriptive manner (Pyari, 2011, p. 95). He, thus, provided an understanding of distance education as guided didactic conversation (viz., communicative action) (Holmberg, 1985). It is possible to deduce what Holmberg perceived as “theory” from his comment that his theory arises from:

... the application of a methodological approach - empathy-creating conversational style – [which] leads to increased motivation to learn and better results than conventional presentation of learning matter. (Holmberg cited in Bernath & Vidal, 2007, n.p.)

Holmberg refers to Johann Gustav Droysen and Wilhelm Dilthey (Bollnow, 1967; Bernath & Vidal, 2007), thus trying to place his theory within the realm of hermeneutics and the concept of *Verstehen* (understanding). To explain, Holmberg’s concept of *Verstehen* is couched in the process of selecting and interpreting texts which are to be narrated. This is partially in line with Gadamer’s double hermeneutics (cf. Ginev, 1998; Gadamer, 1975). However, Holmberg interprets double hermeneutics in a different key. He proposes that there are two hermeneutics, rather than double hermeneutics in play. One is the author’s presentation of “facts” and the other is the interpretation of the “facts” by the reader. The presentation of “facts” may well be perceived as an empirical notion couched in *Erklären* (explaining), and the interpretation may be seen as couched in the process of *Verstehen*. Put simply, this means the author constructs a “factual” world, which the reader interprets by constructing the meaning from the author’s “factual” narrative (Juler, 1992).

Moore takes a similar view to that of Holmberg. Bernath & Vidal (2007, n.p.) explain that Moore argues that “. . . theory is the statement of what is known as the prelude for research that is discovering what is not known.” They argue that Moore sees theory as a map which encapsulates what is known and identifies what is unknown. Thereby, Moore perceives theory as an epistemic framework, including both empirical and hermeneutic inquiry modes, consisting of explanation (*Erklären*) and understanding (*Verstehen*) of given phenomena.

Having briefly identified the three classical theorists’ understandings of theory, it is now possible to turn to the epistemological constructs of their classical distance education theories specifically.

---

## Epistemological Constructs of Classical Distance Education Theories

In order to comprehend and analyze a theory, it is necessary to establish its epistemological basis. That is, only when it is revealed what counts as knowledge and how it is constructed is it possible to understand a theory. A brief elucidation may be in place.

Bernath & Vidal (2007) report Holmberg as stating that:

[s]cholarly theories imply a systematic ordering of ideas about the phenomena of our field of inquiry and are usually of two kinds. One is concerned with *understanding*, the other with *explanation* and prediction. (n.p.) (Authors' emphases)

Thus, one should be able to ascribe to each theory an inquiry mode (Habermas, 1972), which in turn identifies the epistemological grounding.

### **Otto Peters' Distance Education as an Industrialized Form of Education Theory**

Peters' (1971, 1973) industrialized form of education theory is premised on principles of industrialization in the 1960s and thus reflects the proposition that distance education is an industrialized form of teaching and learning. His theory is based on explaining (*Erklären*) distance education through his observations of its practice. In constructing his theory, Peters focused on technical aspects of distance education or what Habermas (1972) would term as an *empirical-analytical inquiry mode* with its *technical interests*. This allows Peters to firmly root his theory in technology and economics. From this epistemological vantage point, Peters contrasts distance education with face-to-face education and delineates the former as a standardized educational mass system. This system, according to Peters, is delineated by constituents, such as rationalization, division of work among cooperating individuals, mechanization of material production and dissemination, and planning and mass production akin to Fordism (Farnes, 1993; Campion, 1999). In effect, Peters' theory generates the same constituents as the operationalization of the theory. Thus, the theoretical and operational constituents of Peters' industrialized form of education may lead to the conclusion that it is akin to industrialized production processes (Peters, 1993a, 1993b).

### **Börje Holmberg's Guided Didactic Conversation Theory**

In contrast, Holmberg's theoretical foundation is couched in the concept of understanding (*Verstehen*) and interpretation of the communication phenomena leading to *guided didactic conversation* theory. Holmberg et al. (1982) claim that his theory is both empirical and interpretative; however, a review of Holmberg's work shows that there is a limited substantive empirical basis underpinning his theory. To clarify, Holmberg focuses on distance education from an interpretive vantage point, providing an understanding concerning communicative and social interaction. This may be aligned with Habermasian interpretive (historic-hermeneutic) epistemology based on *practical interests* (Habermas, 1972).

Holmberg provided three theoretical stances: (i) the *guided didactic conversation theory*, (ii) the *empathy approach theory*, and (iii) a *one-to-one relationship between tutor and learner* theory. Holmberg tried to build his *empathy approach theory* on Popperian *critical rationalism* and empirical testing and on Bloom's taxonomy.

However, as far as the former goes, there is no evidence to show that his *empathy approach theory* has been tested and that it is falsifiable. Rather, Holmberg only hypothesized that an empathetic conversational style is motivational and promotes learning (Hülsmann, 2008).

Holmberg's *one-to-one relationship between tutor and learner* theory (Holmberg, 2003) hypothesized that distance education facilitates a *one-to-one association* between an individual learner and the learning facilitator. Holmberg (2005) saw this association in a distance educational environment as unique, perhaps akin to Oxbridge tutorials. This presupposes that each learner has a separate and independent communication conduit to their learning facilitator. Arguably, this may occur, but this theory fails to address the extent to which, in distance education, a *one-to-one association* exists between learners themselves.

Holmberg's main contribution to distance education is his *guided didactic conversation theory*. Arguably, this theory encompassed some elements of the two preceding theoretical notions. In *guided didactic conversation theory*, Holmberg (1983) transferred the responsibility for teaching (learning facilitation) to course designers. He argued that due to the space-time dichotomy in distance education, the communication process imposes the requirement to reorganize the teaching-learning process. He proposed that distance education cannot mirror the face-to-face teaching-learning environment. Thus, distance education needed to incorporate (i) the extrication of content presentation from the teaching-learning interaction and (ii) the receptive space-time interaction, whereby the main teaching responsibility is transferred from communicative action to content presentation (Holmberg, 1983, 2003, 2005). Although others previously had theorized instructional design as tutorials in print, Holmberg took this further by arguing that one can incorporate a Socratic dialogue as a communicative (inter)action into the content. In so doing, it is theoretically possible to shift the locus of teaching-learning process to course development. Holmberg's theory captured the aforementioned concept of Socratic dialogue cum communicative (inter)action into the realm of distance education.

## Michael Moore's Transactional Distance Theory

Moore's *transactional distance theory* (Moore, 1992, 1993, 1997, 2013) is based on a proposition which allows for a nexus between the concepts of *understanding* and of *explaining* distance education. This theory represents the distinctive characteristics of the relationship between the learner and the learning facilitator within distance learning activities (cf. Moore, 1993). Thus, Moore's theoretical stance allows for the existence of idiosyncratic distance education practices which interpret and support social interaction allowing for learners' emancipation through Moore's (1972) notion of autonomy.

In essence, Moore's theory is located within three substantive constructs: (i) structure, (ii) conversation or dialogue as constituents of communicative action, and (iii) learners' autonomy. Structurally, Moore delineates an educational or learning experience, as determined by a learning activity (Moore cited in Holmberg,

1986, p.110). Communicative action or dialogue in Moore's concept of transaction identifies the distinct relationship between the learner and the learning facilitator. This brings the learning experience to the fore and articulates the meaning of such an experience for the learner. Learners' autonomy refers to degree to which learners are able to shape their aims and objectives and assessment and evaluation parameters.

These epistemological stances enabled the emergence of different and stand-alone distance education theories. To summarize, while Peters focused on the technical aspects of distance education leading to his industrialization theory, Holmberg focused on communicative action, and Moore bridges the understanding and communication gap between the learner and the learning facilitator due to the geographic and psychological distance.

It is evident that Peters, Holmberg, and Moore constructed their distance education theories from different epistemological perspectives. However, gradually each theory has been subjected to Kuhnian (Kuhn, 1996) paradigmatic shifts which enabled other scholars to advance the theoretical foundations of distance education, leading to different "new" theories and discourses to emerge. With this in mind, it is possible to consider the operationalization of each classical distance education theory at an operational level.

All three classical theories of distance education are substantively delineated by their operational level. In other words, the three classical theories emerged, or have been constructed through, an inductive epistemological approach. Peters, Holmberg, and Moore progressed from observing and understanding specific operationalizations to theorize broad generalizations. These generalizations formed the basis for the advent of distance education theories and subsequent operationalizations of distance education.

---

## Operationalization of the Classical Distance Education Theories

From an operationalization perspective, Peters was arguably the first to have an effect on the operations of distance education, partly because he addressed the industrialization of distance education that was already evident, and his theory helped shape and manage its future models (Peters, 2003). In this respect, Peters (2007) emphasized that distance education needed to be viewed from the socioeconomic framework of the times. As such, he was theorizing during the period when (as we discuss in the next section) mass distance education—especially in the form of the nascent OUUK—was emerging. Key features of industrial society were discernible in distance education, such as the application of technologies (see Peters' [2013] critics of digitalization), division of labor, mass production, economies of scale, standardization of production, and organizational process rationalization.

The two operational "macro-factors" arising from Peters' theory are *organization* and *economics*. The former is aligned with the division of labor, the application of technologies, and the process rationalization. The latter is underpinned by economies of scale, mass production, and the standardization of production.

In comparison with Peters' theory, Holmberg's *guided* didactic conversation theory was less obviously operationalized in distance education. It may be argued that Holmberg's theory has been influential by recognizing the proposition that distance education in its diverse forms and levels is characterized by addressing the time-space dimension. This leads to operationalization of support services and learning design and its effectiveness across time and space. Operationally, the *guided* didactic conversation theory advocates an organized teaching-learning program and process (Holmberg, 1983, 1985) which is now integral to distance education.

At its operational level, the theory of transactional distance addresses the communicative action gap between the learner and learning facilitator due to the geographic distance (Moore & Kearsley, 2005). Operationally, this gap may be bridged by applying appropriate instructional design features as well as facilitating interaction between teachers and students (Bernath & Vidal, 2007). This, according to Moore, includes policies, procedures, and facilities at the institutional level, such as learning resources, design, delivery, and interaction to constitute the learning habitat. These may be viewed as operational "macro-factors" of transactional distance education. The operationalization of Moore's theory is based on program structure (i.e., course content analysis), dialogue (i.e., interactions between learning facilitator and learners), and autonomy (i.e., learner's participation in decision-making concerning the time, place, and substance of their learning) (Moore, 1972, 1976).

In order to appreciate the significance of the classic theories and their operationalization, we now turn to understand the historical context in which Peters, Holmberg, and Moore formed their theoretical positions.

---

## **A Background to the Emergence of Open and Distance Education Theorizing**

As is explained above, our classic theorists of distance education had their intellectual and experiential roots in the mid-twentieth century. Holmberg first published on distance education in 1960, Peters in 1967 (see Zawacki-Richter, 2019), and Moore in the early 1970s. These were interesting times historically as the world emerged from the clouds of World War II into the sunshine of the modernizing 1960s and 1970s—notwithstanding the Cold War chill! These 1960s and beyond developments—in what became known as "distance education" by the 1980s—evolved alongside developments in media and communications technology into the (largely) online distance education world we have today. The work of the classic theorists, directly (through their leadership positions in distance education) and indirectly (through others' use, interpretations, and development of their writings), helped shape this world. The classic theorists, however, also benefited from the significant earlier developments of what came to be known as "distance education" from the 1980s.

The term "distance education" embraced the practices incorporated by the earlier terms, "correspondence education," "correspondence schooling," "external studies," "university extension," etc. These earlier forms can be traced back to the nineteenth century when print (e.g., typewriting, typesetting) and communications

(postal services) technology developed alongside the emerging needs for schooling and skills training. The “classic” early example is Pitman’s shorthand training being offered using postcards with written instructions and tasks sent to and from students via the new “penny postal” service in the 1840s in London and later throughout the UK. One hundred and sixty years later, Tait (2003) reflected on the Pitman’s courses as being especially significant in terms of the two-way communications and the individual support this enabled for the students. Striving for interaction between teacher and learner, and between learners themselves, has become an intense focus in pre-distance education theory and practice, especially in the work of Charles Wedemeyer in the USA (Latchem, 2019, pp. 11–12).

The early twentieth-century correspondence schooling became an important means of providing education for children in rural and remote communities in nations, such as Australia, Canada, and the USA, with large land masses and geographically distributed settlements. In Australia, Adelaide Miethke deployed the shortwave radio network developed for the Royal Flying Doctor Service, to enable teachers to provide scheduled “classes” over the air from the 1950s until the rise of telecommunications and the Internet replaced radio. An important consideration here is that such post-World War II educational developments were substantially influenced by their governments’ concerns for social and economic development for their populations. Doubtless, our classic theorists were influenced by the public adoption of such social and economic imperatives and the validation it gave to them to begin their theoretical journeys.

Arguably, one of the major twentieth-century developments in higher education was unfolded in the UK during the 1960s and influenced the work of the classic theorist. The Wilson Labour Government, elected in 1964 on a platform of social, economic, and educational reform (Hennessey, 2019), embarked on major reforms to primary schooling (Plowden Report, 1967) and the abolition of tripartite secondary education and the establishment of comprehensive education (“Circular 10/65”, n.d.). For people in higher education, especially those around the world working in forms of correspondence education, external studies, etc. (see Smith [1984], for example, from Australasia and the South Pacific), it was the establishment of the OUUK that really made a profound difference. It fuelled not only reform to tertiary education in the UK; it energized distance education theory and practice internationally and, of course, launched the idea of an “open university”: one that was open to all. Evans & Nation (1989) describe how Harold Wilson, after observing, in 1963, technical education by correspondence in Moscow, and also the work of *Encyclopedia Britannica* in its educational films became captivated with the idea of a “university of the air” for the UK. This eventually became the Open University with the British Broadcasting Corporation (BBC) providing broadcasts “over the air” (MacArthur, 1974, pp. 4–6; Perry, 1976, pp. 10–11). The Wilson Government established the OUUK as a major step toward modernizing post-War Britain through educating its citizens and, therefore, its workforce. It was to prove much more than that for the world and for theorizing distance education.

The OUUK was established in 1969 and enrolled its first students in 1971. Its first location was in the old BBC studios at Alexandra Palace in London; it later moved to

new premises in Milton Keynes (then a “new town” growth area) 90 kilometers northwest of London. New BBC studios were included on the campus for the OU to develop the BBC radio and TV programs broadcast to its students (and anyone else with a TV). This was a major use of media and communications technology in distance education. This was possible in the UK because of the BBC’s national radio and TV broadcast coverage. This was something that Australia and Canada, for example, could not achieve (especially with TV) through their national broadcasters due to their smaller populations distributed across their vast expanses and different time zones, although, as noted previously, shortwave radio was used (such as for the School of the Air) and some local radio stations, too (Arger, 1989).

The OUUK’s integration of educational technologies was a core feature of its development. An Institute of Educational Technology (IET) was established to inform, research, and guide the OUUK’s course development. Harris (1987), in a study of the OUUK in the 1980s, observed “a cheerful operationalisation pervades the work of ‘educational technology’ . . .” (p.2). There appears to be little influence of the classic theorists over this period in the OUUK. Harris’s work makes it clear that there were many contradictions and tensions between the IET staff themselves and also with other academic and nonacademic staff. Indeed, Harris (1987, pp. 26–7) discusses the work of the Survey Research Department (SRD), which “in the early days at least was concerned with market research” and “reflected a strong concern for public relations” and lacked comparability with contemporary sociological or educational research or, one assumes, from the nascent classic theorists’ work, although Peters’ theory, in particular, related well to the SRD’s “industrial” approach. Harris reports that the SRD’s marketing and public relations focus met with “resistance from some junior members” of the SRD. (From 1985, this formed part of the new Student Research Centre [SRC] which remains today.) An example of these young resisters can be found in the work of the late Alistair Morgan. He was a passionate advocate for, and practitioner of, substantive qualitative research into distance students’ learning (Morgan, 1993). He argued strongly that the SRC (and others in the OUUK) should move “beyond (the) mindless data collection” of rudimentary surveys (Morgan, 1990, p.10) and the “mindless empiricism” that underpinned it (p.13).

Like Harris, Morgan saw that there was a rich vein of social and educational science theories that could be applied to the OUUK’s institutional research. A key point here, in terms of understanding the rise of the classic distance education theories, is that the OUUK was established to address the social and (higher) educational inequalities in the UK—not just to provide “regular” selective higher education at a distance; it was to be “open learning”—This theoretical concept reflected the political and pedagogical imperatives of the time (Jakupec & Nicoll, 1994).

The classic theorists of distance education were differently influenced by the OUUK’s rise to prominence in open and distance education. Moore was a OUUK staff member between 1977 and 1986. He then returned to the USA where previously, in the early 1970s, he worked with, and was influenced by the work of, Charles Wedemeyer at the University of Wisconsin-Madison on correspondence

education and independent learning (Diehl, 2013). More recently, Holmberg and Peters received honorary doctorates from the OUUK for their contributions to distance education. This suggests that there were some mutual influences between the theorists and the OUUK. We now turn to discussing how the classic distance education theories were subsequently interpreted by others.

---

## Interpretations of Classical Distance Education Theories

The literature shows that there is no unified, general theory of distance education. Over 30 years ago, Keegan (1986) proposed that distance education theories fall into one of the following groups: (i) industrialization theories, (ii) independence and autonomy theories, and (iii) interaction and communication theories. However, nowadays, some distance education theories are based on established communication and educational theories (Pyari, 2011).

From Keegan's vantage point, the interpretation of distance education theories may well lead to the conclusion that it is a more industrialized form of education when compared to conventional face-to-face education. But this does not mean that other aspects of distance education, such as independence and autonomy, and interaction and communication are absent. Distance education, at an interpretative level and based on the classical theories, can be thus perceived as a systematically planned endeavor. The constituents of such an endeavor include didactic groundwork as it relates to teaching-learning activities and learners' choice including learners' independence and autonomy, supervision, guidance, and support. It is important that all these and other relevant constituents should be enacted within a framework of physical distance and often based on an asynchronous time frame. At interpretational level, this requires bridging the space-time gap using some form of technology, as well as forms of texts and media (Hawkrigde, 2002).

It is possible to focus on the interpretation of distance education theories by using (i) Keegan's (1993) theory of teaching-learning integration, including two-way communication; (ii) Garrison's (1993) communication and learner control theory, emphasizing a nexus between technology and self-directed learning; and (iii) Verduin & Clark's (1991) theory of dialogue and support including structure and content and two-way digital mediation. The rationale for focusing on these three theories and projecting them into the realm of interpretation is twofold: First, they include the above-stated endeavors to various degrees. Secondly, they are constituted from the existing classic distance education theories and have their analytical frameworks which lend themselves to be translated into interpretational structures based on two or more of the classic distance education theories.

## Keegan's Integration Theory of Teaching-Learning

Keegan's (1993) integration theory relies to a large extent on aspects of two-way communication. However, it also has partially its roots in Peters' (1983) notion of

distance as a barrier which can be overcome using technologies and decision-making processes. This means overcoming barriers to enhance the relationship between actors through technology is seen by Keegan (1993) as a reintegration of the teaching-learning activities. Keegan (1996) provides an analysis of the classical distance education theories and articulates a new extended theory of distance education based on the following constituents:

- (i) The quasi-permanent separation of teacher and learner throughout the length of the learning process
- (ii) The influence of an educational organization both in the planning and preparation of learning materials and in the provision of student support services
- (iii) The use of technical media—print, audio, video, or computer—to unite teacher and learner and carry the content of the course
- (iv) The provision of two-way communication so that the student may benefit from or even initiate dialogue
- (v) The quasi-permanent absence of the learning group throughout the length of the learning process (p. 50)

Keegan (1993) believes that distance education requires activities similar to those of face-to-face educational transaction. He states:

... a theoretical structure for distance education focusing on the reintegration of the teaching acts by which learning is linked to learning materials may go some way to compensating for the location of the students, causing the lack of eye-to-eye contact which is so important in education. (Keegan, 1993, p. 131)

His view is important because it advocates face-to-face educational transactions which are found in Holmberg and Moore's theories. There is a subtle difference, however, in that the latter two theorists assume learners have a greater ability to take responsibility for their learning than does Keegan. Nevertheless, major aspects of Holmberg and Moore's theories reside in Keegan's integration theory of teaching-learning.

## **Garrison's Communication and Learner Control Theory**

The center of Garrison's (1993) communication and learner control theory is the nexus between technology and self-directed learning. Garrison (2000) suggests that the focus of distance education theory should be understanding the teaching-learning processes which occur at a distance through utilization of a range of methods and technologies. He argues that distance education theories should reflect collaborative teaching-learning, which are focused on adaptive teaching-learning transactions. Thereby, Garrison suggests changing from the classic distance education theories which focus on the organizational and structural aspects of distance education to one which focuses on transactional teaching and learning processes. The central concepts

of Garrison's communication and control theory are educational transaction, learner control, and communication. These three concepts are underpinned by the facilitation of educational transactions and are influenced by communication theories.

Garrison's theory of communication and learner control also contains similar elements to those in Moore's transactional distance education theory. Garrison (1989, cited in Amundsen, 1993, p. 67) states that "...the educational transaction is based upon seeking understanding and knowledge through dialogue and debate..." and, therefore, necessitates two-way communication between teacher and learner. The proposition is that a two-way communication be administered in a way that control over the teaching-learning transaction is negotiated between the learning facilitator and the learner and should be supported by appropriate technology. The concept of learner and learning facilitator control is thus proposed partly instead of the concept of independence or autonomy embedded in Holmberg's *guided didactic conversation* theory and Moore's *transactional distance theory*.

### **Verduin and Clark's Theory of Dialogue: A Three-Dimensional Theory of Distance Education**

Verduin & Clark's (1991) theory of dialogue is a three-dimensional distance education theory built on the classic distance education theories. It uses mainly Moore's *transactional distance theory* and Keegan's *integration theory of teaching-learning*. The three dimensions are as follows:

*Dialogue/support dimension*, which focuses on dialogue. In this sense, "dialogue" is applied as a full support for the benefit of the distance learner. In short, dialogue is the primary activity ensuring full support (Verduin & Clark, 1991).

*Structure/specialized competence dimension* as a definitional structure of the formality of the subject matter. Verduin and Clark argue that some subject matter or learning subjects may be basic and thus require only a minimal structure. Conversely, a subject matter may require a high structure. This applies especially to learning disciplines "...in which many years of study may be necessary before a learner is competent enough to set objectives and study methods or to take part in evaluation" (Verduin & Clark, 1991, p. 125).

*General competence/self-directedness dimension*. This dimension differentiates between suitable self-directedness or autonomy levels and assessment of the learner's general competence, to ascertain to which extent appropriate structure and dialogue have been afforded to the learner (Verduin & Clark, 1991).

Verduin & Clark (1991) suggest that these three dimensions may form a continuum allowing for diverse combinations. They perceive the combination as fitting most problem-based forms of distance education.

It is evident that the above interpretations of classical DE theories provided by Keegan, Garrison, and Verduin & Clark, respectively, not only have shed light on the above cited and discussed works of Peters, Holmberg, and Moore but also have extended it further. Their respective interpretations do not fit exactly into the three main categories stated above, namely, (i) industrialization theories, (ii) independence

and autonomy theories, and (iii) interaction and communication theories. Keegan, Garrison, and Verduin and Clark were instrumental in crossing the boundaries of the classical distance education theories.

As one may expect, the rapidly evolving field of distance education from the 1980s prompted many more interpretations of the classical theories of distance education. For example, Rumble (1989) provided a wide-ranging analysis of the constructs of distance and openness, respectively. Perraton (1987) advanced a distance education theory focusing on teaching, administration, and assessment as three interrelated systems. Evans & Nation (1989) identified dialogue as the quintessence of practice, research, and theory in distance education. There are several others, too, some of which are reflected in this handbook but which are beyond the capacity of this chapter.

---

## Concluding Reflections

The invitation from the editors to write a chapter on the classic theories of distance education prompted the authors to reflect on their first experiences in distance education. They both commenced at Deakin University's Institute of Distance Education in the mid-1980s with backgrounds in teaching and research in distance education. Their significant early work together was on the development and teaching of the Master of Distance Education (MDEd) program jointly offered by Deakin University and the University of South Australia (Calvert, Evans, & King, 1993). The MDEd provided students with a critical understanding of distance education's roots, theories, and practices. The final part of the program focused on learning about research methods and methodologies (Evans & Nunan, 1993) and then the students practicing a small piece distance education research using appropriate and ethical procedures (Evans & Jakupec, 1996). An important goal of the program was to strengthen research capacity in distance education by providing graduates with the background to pursue applied research and evaluation in their workplaces and, for some, doctoral research in (and through) distance education (Evans, 2008; Evans & Green, 2013).

To achieve these ends for the students, the teaching staff drew on the theoretical work of Holmberg, Moore, and Peters, plus the contributions of the (then) emerging scholars of open and distance education. Writing this chapter required returning to the authors' work at the time (e.g., Evans, 1989; Evans & Nation, 1989, 1992, 1996; Evans & Jakupec, 1996; Jakupec, 1996; Jakupec & Nicoll, 1994) to identify its foundations in the work of the classic theorists and those who interpreted it. Sadly, during this preparatory period, the authors learned that Börje Holmberg died at the age of 97 on April 10, 2021. Hence, distance education lost a leading figure in the theory and practice of distance education. He was awarded honorary doctorates by the OUUK and Deakin University for his significant contribution to the field. It has been timely to recognize this work in here.

There are two inescapable major conclusions that emerge from reflecting on the work of the classic theorists. One is that the social imperatives of—and for—distance education persist into the twenty-first century. From schooling to universities, distance education is deployed to provide learning opportunities for people at times and places to suit their needs and circumstances (e.g., Jakupec, 2011). Indeed, the COVID-19 pandemic prompted governments in developed and developing countries to close schools and require them to “teach online.” Furthermore, universities continue to provide MBAs, MEds, M Nursing, etc., and even doctorates, for professionals to address the emerging national and global needs for an enlightened and informed workforce (Berge, 2013; Dunning & Evans, 2009; Evans, 2008; Evans & Green, 2013; Kuhne, 2013).

The second major conclusion is that distance education continues to reposition and repurpose itself by adopting and adapting new technologies to its purposes: from Pitman’s postcards in the nineteenth-century to the twenty-first-century virtual reality (Evans & Pauling, 2021). Such repositioning and repurposing sustain distance education at the forefront of educational change to address social and economic imperatives. A pertinent example is Meier and Jakupec’s (in press) work on the impact of COVID-19 on digitalization in higher education. As discussed above, such changes have not been without their critiques and challenges (Jakupec, 1996; Peters, 2013), and one may expect there will be more to come!

This chapter shows that critiques and challenges, especially those embedded within sound and substantive theorizing, are a fundamental component of the intellectual substance of distance education. The work of Otto Peters, Börje Holmberg, and Michael Moore provided the theoretical foundation upon which others have built over the recent decades. The cumulative effect is an expanding theoretical reservoir from which practitioners can draw, and to which they can contribute, to create future of distance education.

## Abstract

The emergence of newer theories for digital learning spaces occurs because of a general dissatisfaction with the theorizing of earlier generations of open and distance education (ODE). After an outline of the traditional conception of the requirements for a “learning theory,” this chapter traces the sources for this dissatisfaction in traditional theories such as behaviourism and cognitivism, then traces some theoretical attempts to address them. It identifies a range of emerging theories, including connectivist pedagogy, personal learning environments, and open educational practices, characterizing these in terms of their response to the original dissatisfaction. It then returns to the characterization of a “learning theory,” suggesting that in the light of this new work a reconceptualization of theory may be required.

## Keywords

Open and distance education · Connectivism · Theory · Digital learning · Open educational practices

## Introduction

If it is true that “There is nothing so practical as a good theory” (Lewin, 1952, p. 169), then open and distance education (ODE) has been awash in practicality since its inception more than a century ago. We are at once told that key research questions were already answered decades ago and yet see for ourselves the proliferation of new theories with the development of each new delivery technology. Is this because of an ahistorical perspective, as Selwyn (2012, p. 216) suggests? Is it true that we are locked in an endless cycle of contextualization and generalization, as Jung (2020) suggests? Or is it different this time?

The emergence of newer theories for digital learning spaces occurs because of a general dissatisfaction with the theorizing of earlier generations of ODE and not as a result of ignorance of it. This dissatisfaction is manifest in several dimensions, each of which will be explored through the course of this chapter.

In earlier generations, for example, distance education (DE) was presented as addressing a *transmission* challenge, while in the digital era a much broader conception of learning *environments* is considered. Earlier generations reflected an emphasis on *content* and learning design, while in the digital era context and community assume a much greater importance. Earlier generations depict knowledge as consisting of idealized *representations* and schemas, while in the digital context knowledge is intuitive and contextual. And finally, earlier generations think of learning as a cognitive process based essentially in logical structures such as language and mathematics, while in the digital era learning is understood as a physical process based on adaptation to concrete experience.

These are important distinctions, though not without precedent in the historical literature. The philosophically minded will recognize elements of the historical division between rationalism and empiricism, while those schooled in the history of education will recognize the contrast between what might be called traditional and progressive education. What’s *new* with digital technology and digital learning spaces, however, is the possibility of expressing theory precisely in technology and experiencing for ourselves answers to questions that could not even be asked in pre-digital environments.

And so the dissatisfaction with more traditional forms of theorizing in education is also a dissatisfaction with the posing of questions and experimental methods rooted in non-digital forms of investigation and theorizing. For example, the problems of education are often represented as *statistical* problems, addressed through the social sciences or economics, rather. Complex phenomena are *interpreted* using the broad generalizations of folk psychology rather than analyzed and understood at an individual and personal level.

Finally, there is dissatisfaction with traditional conceptions of what sort of questions we are attempting to answer. This arises most clearly in the light of asking “what is a theory?” What *work* do we expect a theory for digital learning spaces to do? What sort of questions need it answer? Again, we find the question changes the more deeply we are engaged in digital learning technology. To this, then, we turn first, as a prelude to the remainder of the discussion.

## What Is a Theory?

The word “theory” is used differently in different domains. In physics we see the “theory of gravity” while in language studies we see “critical theory.” So too in the fields of education and technology, a theory may be taken as being anything from a “lens” through which to interpret phenomena to a set of causal mechanisms explaining learning behaviour and practice. The theory guiding the practice of ODE is often characterized under the auspices of “learning theory,” which in the field of education has a broad connotation.

As Picciano (2017) writes,

Learning theory is meant to explain and help us understand how people learn; however, the literature is complex and extensive enough to fill entire sections of a library. It involves multiple disciplines, including psychology, sociology, neuroscience, and of course, education. (p. 166)

This is most clear when we consider the multiple purposes to which theories are put in education. Gibbons and Bunderson (2005) describe theories that: *explore*: “what exists?” attempting to define, describe and categorize; *explain*: “why does this happen?” looking for causality, correlation, and relationships; and *design* “how I achieve this outcome?” describing interventions for reaching targeted outcomes and operational principles (Graham et al., 2013, p. 13). These correspond with three ways of seeking knowledge about the world: through exploration, typically through qualitative research methods, which may establish the existence of an entity (an object, a problem, a perspective); through explanation, which often involves quantitative methods, to address questions of identity, relatedness, and causality; and design, which explores the possibility of creating a particular outcome.

Much, if not most, discussion of technology in education revolves around the first and especially the second question. Learning (or pedagogy) and technology are presented as two *separate* domains, and theory addresses the causal relation between them. For example, Kanuka (2008) describes three major approaches to a theory of technology: *uses determinism*, which “emphasizes technological uses and focuses on the ways in which we use technologies”; *social determinism*, “concerned with the integration of technological artefacts within social systems and cultural contexts”; and *technological determinism*, where “technologies are viewed as causal agents determining our uses and having a pivotal role in social change” (pp. 96-98). Each of the three approaches also offers a platform for the criticism of technology in learning. For example, Kanuka quotes Jonassen (1996) on uses determinism: “carpenters use their tools to build things; the tools do not control the carpenter. Similarly, computers should be used as tools for helping learners build knowledge; they should not control the learner” (Kanuka, 2008, p. 4). Critics of social determinism include Putnam (*Bowling Alone*, 2000) and Turkle (*Alone Together*, 2011). Major critics of technological determinism include Noble (1998), Postman (1992), Dreyfus (2001), and Watters (2021).

Both the Gibbons and Bunderson discussion and the Kanuka discussion present as “theory” something along the lines of the classical Deductive-Nomological (DN) Model where a scientific explanation consists of an *explanandum*, a sentence “describing the phenomenon to be explained” and an *explanans*, “the class of those sentences which are adduced to account for the phenomenon” (Hempel and Oppenheim, 1948, reprinted in Hempel, 1965, p. 247). The relation between the explanans and the explanandum may be deductive, as in determinist theories, or it may be statistical, as commonly found in theories of the social sciences, including education. A common criticism of DN model theories is that they are *reductive*, that is, they are held to be *unificationist* in the sense of attempting to provide a unified account of a range of different phenomena, for example, by explaining learning through too “low” a science (Sayer, 2010, p.5) or attributing sole responsibility to individuals for their fates (Sayer, 2010, p. 7). And so, through a rejection of reductionism, theories proliferate, each specific to its own level of discourse, its own context, or its own discipline. And yet digital learning practitioners are expected to agree that “key research questions were already answered decades ago.”

A deeper critique may be found in questioning the distinction between *explanans* and *explanandum* that forms the basis for HD-style theories. Digital technologies have fostered the rise of complex network technology that defies explanation in such simple terms. Network interactions, whether the conversations of a billion internet users or the workings of a billion-parameter artificial intelligence, cannot be understood in terms of anything like a DN model. There is no distinction that can be drawn between that which explains, and that which is being explained.

---

## Traditional Learning Theories

Designers of early digital learning environments were influenced by, and drew from, a range of learning theories developed in previous generations. These theories, in turn, were influenced by major schools of thought in the philosophies of science and psychology.

Canonically, the first of these is *behaviourism*. Developed in the first part of the 1900s by authors including B.F. Skinner (*Beyond Freedom and Dignity*) and Gilbert Ryle (*The Concept of Mind*) behaviourism was offered as a response to dualist theories that posited a nonphysical “mind” that had special cognitive abilities and insights into the nature of the self and reality. behaviourism limits its conclusions to what may be observed and measured, and therefore describes learning and development in terms of stimulus-response (Skinner) and knowledge and skills as dispositions (Ryle, 1949). There is, according to behaviourism, no “mental state” constituting a single bit of knowledge or a skill; one might (in today’s terms) think of it as a “whole of body” response.

Behaviourism, as Watters (2015) explains, is the philosophy behind the concept of the “teaching machine” and proceeds by incremental conditioning.

By arranging appropriate ‘contingencies of reinforcement,’ specific forms of behaviour can be set up and brought under the control of specific classes of stimuli. . . a student is ‘taught’ in the sense that he is induced to engage in new forms of behaviour and in specific form upon specific occasions. (Skinner, 1958, p. 970)

“Behaviourism has persisted, although often unnamed and un-theorized - in much of the technology industry, as well as in education technology – in Turing machines not simply in teaching machines” (Watters, 2015).

In what might be thought of as a response to behaviourism, *cognitivism* emerged in the later 1900s. It postulates the existence of causally relevant *cognitive states* that can be located in the mind and are able to better explain mental phenomena such as reason and language better than stimulus and response (which, proponents such as Chomsky (1986, Preface, xxv) argue, cannot explain them at all). An example of cognitivism is the physical symbol system hypothesis, which as the name suggests references a possibly innate language of thought (Fodor 1975).

It is arguable that a combination of cognitivism and behaviourism lives on today in the form of adaptive learning. Such systems use digital technology to monitor student activities, including responses to learning tasks, interpret those responses based on domain-specific models, and present them with new activities or resources in order to address learning needs, hence embracing a cognitivist model of learning. However, as a procedural system, adaptive learning is inherently behaviourist. Stimuli and student responses are mapped to cognitive schema or frames, perhaps as “production rules” as in the Intelligent Tutoring System of Anderson et al. (1985). Formally, however, production rules and dispositions amount to the same thing, a form of counterfactual reducible (in theory) to observed behaviour.

Digital learning design drawing from *transactional theories* of ODE is similarly both cognitivist and behaviourist in nature. In such theories, the central problem is the communication of information from a sender (in the case of learning, an instructor or learning resource) to a recipient (a student or learner). Such theories describe the forms of online interactions, in the case of Moore (1989), instructor-to-student, student-to-student, and student-to-content, and mechanisms for ensuring the fidelity of transmission where separation between the teacher and students can “lead to communication gaps, a psychological space of potential misunderstandings between the behaviours of instructors and those of the learners” (Moore and Kearsley, 1996, p. 200).

Both traditional education and ODE were influenced by a wave of theories that push back against the idea that knowledge or learning could be “delivered” in the sense that a message or piece of information is delivered, of which the most prominent is *social constructivism*. Constructivism in general is the thesis that knowledge is generated by means of the creation of models, schemas or representations by means of physical symbol systems. As a philosophy of science, constructivism is a form of empiricism (van Fraassen, 1980), while as a theory of learning constructivism responds to innatism by describing learning and development as *social* phenomena (hence, *social* constructivism) employing language, storytelling, community structures, and similar methods of “making meaning.”

A related theoretical approach, *discovery learning*, is based on a model of learning and discovery as problem-solving activities (Laudan, 1978) where learners draw on their own activities and experiences to discover facts and construct theories about the world. The suggestion is that learners are more likely to remember facts and theories they discover on their own than those merely presented to them by instructors (Bruner, 1973). The theory of experiential learning formalizes this idea, describing a process resembling scientific models of hypothesis, prediction, and deduction and in education can be described as a “learning cycle” (; Kolb and Kolb, 2005, p. 195; Kolb, 1984). Papert’s theory of constructionism is a less formal example of this, taking from Piaget “a model of children as builders of their own intellectual structures,” where learners solve problems and develop ideas through an open-ended creative process working hands on with physical or digital objects (Papert 1980, p. 7).

In what might be considered the cumulation of traditional learning theories, the theory of *direct instruction* was developed through criticism of discovery and inquiry-based teaching (Kirschner et al., 2006). Based on the idea of “cognitive load,” which is a limit to a person’s ability to process information at any given time, it suggests that such theories require too much extraneous work on the part of the learner. For example, in problem-based learning, a learner might waste time and effort discovering which formula should be used to find the answer. This extraneous effort, it is argued, limits the learner’s capacity to absorb and retain information. Rather, instruction should be based on directly explaining the concept or theorem to be taught, and then providing a set of “worked examples” that students can follow in order to learn how the problems are solved.

Traditional learning theories have in common a conception of knowledge and learning as a *cognitive* function, even if (as in the case of behaviourism) that function cannot be directly observed. Learning is in some way the stimulation, transmission, or construction or creation of models, schemas or representations that are symbolic in nature and consist of statements of fact and sets of rules or generalizations about those facts. Learning objectives could be stated by enumerating the factual domains to be mastered, or (as in the case of Bloom’s taxonomy) evidence of progressively more abstract actions demonstrating internalization of those rules and representations. In this way, traditional theories of knowledge and learning are structurally isomorphic with DN theories of science.

---

## Toward Newer Theories

Another way of saying that traditional learning theories have in common a conception of knowledge and learning as a *cognitive* function is by saying that such theories are all *knowledge centered*. The dissatisfaction with, and replacement of, traditional theories begins with a challenge to this conception of learning. What we understand by “knowledge and learning” is something more than or different from the cognitive function as traditionally conceived. Thus, for example, we see Bransford et al. (1999) argue that effective learning is community-centered, knowledge-centered,

learner-centered, and assessment-centered. “All learning takes place in settings that have particular sets of cultural and social norms and expectations and that these settings influence learning and transfer in powerful ways” (Bransford et al., 1999, p.4).

Bransford et al. (1999) also describe (following Dreyfus and Dreyfus, 1980, p. 15) how expert knowledge differs from novice knowledge. Experts

notice features and meaningful patterns of information that are not noticed by novices. Experts’ knowledge cannot be reduced to sets of isolated facts or propositions but, instead, reflects contexts of applicability: that is, the knowledge is “conditionalized” on a set of circumstances. (Bransford et al., 1999, p. 31)

Or, learning is *more* than cognitive; it “changes the physical structure of the brain and, with it, the functional organization of the brain” (Bransford et al., 1999, p. 4).

Context, self, community: the emergence of newer theories of learning begins with a new understanding of their importance and “the unique characteristics or affordances of the Web to enhance these generalized learning contexts” (Anderson 2008b, p. 46). None of these were in and of themselves new to the field; as mentioned above, constructivism already emphasized the role of community, and Kolb’s version of discovery learning was based on his understanding of human psychology, for example. But it took engagement with the World Wide Web – the ultimate information processing system – to underline the importance of these other factors.

Several early theories drew on these factors. One such is *adaptive learning*, which is in essence the use of digital (or other) technology in order to select or recommend unique sets of learning resources or activities based on a learner’s prior knowledge and demonstrated capabilities. Intelligent Tutoring Software (ITS), for example, was based in a combination of domain knowledge, a pedagogical model, and a student model (Kravcik et al., 2005, p. 9), which then gave way to adaptive hypermedia models and web-based adaptive educational systems. These were based to a large degree on Semantic Web technologies, and implemented using a combination of learning rules and reusable learning resources, or “learning objects.”

Another was *situated cognition*, the idea that “activity and situations are integral to cognition and learning” and that “by ignoring the situated nature of cognition, education defeats its own goal of providing useable, robust knowledge” (Brown et al., 1989). For example, consider the difference between learning words according to dictionary definitions and learning words in the context of using them in sentences.

Teaching from dictionaries assumes that definitions and exemplary sentences are self-contained “pieces” of knowledge. But words and sentences are not islands, entire unto themselves. Language use would involve an unremitting confrontation with ambiguity, polysemy, nuance, metaphor, and so forth were these not resolved with the extra linguistic help that the context of an utterance provides. (Nunberg, 1978)

Significantly, learning how to use a tool (for example) is not rule-based. In learning how to use tools, people

build an increasingly rich implicit understanding of the world in which they use the tools and of the tools themselves. . . Learning how to use a tool involves far more than can be accounted for in any set of explicit rules. The occasions and conditions for use arise directly out of the context of activities of each community that uses the tool, framed by the way members of that community see the world. (Brown et al., 1989, p. 33)

Similarly,

Conceptual tools similarly reflect the cumulative wisdom of the culture in which they are used and the insights and experience of individuals. Their meaning is not invariant but a product of negotiation within the community. Again, appropriate use is not simply a function of the abstract concept alone. It is a function of the culture and the activities in which the concept has been developed. (Brown et al., 1989, p. 33)

The situatedness of cognition is obscured by the nature and function of schools. Most school activity exists in a culture of its own separate from what students will experience in their workplace and culture. In the school, learning transfer is “assumed to be the central mechanism for bringing school-taught knowledge to bear in life after school.” (Lave, 1988, p. 23) In such a context, problem-solving activities are “always a quest for truth or the ‘right answer’” (Lave, 1988, p. 36). The problem context is “the only context germane to problem-solving activity (Lave, 1988, p. 39). Contrast this account of learning in school with “life after school” where problem-solving is a “process of transformation” (Lave, 1988, p. 59). “The same activity in different situations derives structuring from, and provides structuring resources for, other activities.” (Lave, 1988, p. 122). Doing mathematics in a math class is very different from doing mathematics in a grocery store.

One major outcome of situated learning is the concept of the *community of practice*. “A person’s intentions to learn are engaged and the meaning of learning is configured through the process of becoming a full participant in a sociocultural practice” (Lave and Wenger, 1991, p. 29). A good example of this is the apprenticeship, where new members of the profession are gradually moved from peripheral participation involving limited duties to more and more central roles. This same process takes place less formally in other professions. A “person” becomes a “practitioner” “whose changing knowledge, skill, and discourse are part of a developing identity” (Lave and Wenger, 1991, p. 122). Hence, on this theory, “*knowing* is inherent in the growth and transformation of identities and is located in the relations among practitioners, their practice, the artifacts of that practice, and the social organization and economy of communities of practice” (Lave and Wenger, 1991, p. 122).

We see a similar perspective represented in the “community of inquiry” model for online learning environments developed by Garrison et al. (1999). This model is based on the interplay of three types of “presence”: social presence, cognitive presence, and teaching (or perhaps learning) presence. The concept of social presence especially identifies a connectedness between people in a learning environment.

Collaboration must draw learners into a shared experience for the purposes of constructing and confirming meaning. Realizing understanding and creating knowledge is a collaborative process. The difference between collaboration and common information exchange is: . . . the difference between being deeply involved in a conversation and lecturing to a group. The words are different, the tone is different, the attitude is different, and the tools are different. (Garrison et al., 1999, p. 95)

We see in this work of the late 1990s and the early 2000s the development of each of the major themes characterizing emerging theories for digital learning spaces. It became apparent that knowledge and learning are based on much more than mere transmission of information, as the nature of the learner and the learner's environment play key roles, and context and community assume a much greater importance. Because these must be explicitly created in a digital learning environment, rather than inherent in, say, a classroom or workplace, their nature and development assumed a greater importance in learning theory and design. It also became apparent that learning and domain knowledge consist of more than idealized representations and schemas, more even than logical structures such as language and mathematics. While these cognitive phenomena continue to play a major role in learning theory, there is an increasing recognition of the importance of the ineffable properties of personal knowledge and learning communities.

---

## Newer Theories for Digital Learning Spaces

Much of digital learning research in the early twenty-first century was devoted to the idea of learning communities, collaboration, and co-construction of knowledge. Haythornthwaite et al. (2007) provide a good overview of six major approaches, including living technologies, co-evolution of technology and learning practices, and technology and social tie formation. The importance of interaction was emphasized. "The main function of reasoning, we claim, is argumentative. Reasoning has evolved and persisted mainly because it makes human communication more effective and advantageous" (Mercier and Sperber, 2011, p. 60).

Such discussion also led to the idea that cognition is not confined to the brain but partly distributed and realized in our interactions with the environment.

The human organism is linked with an external entity in a two-way interaction, creating a *coupled system* that can be seen as a cognitive system in its own right. All the components in the system play an active causal role, and they jointly govern behaviour in the same sort of way that cognition usually does. (Clark and Chalmers, 1998, p. 8)

Paper-and-pencil calculation is the standard example. The social processing of information can be conceived as a species of extended cognition where our cognitive processing is distributed into the social environment and supported and constrained by social interaction.

It therefore became a matter of considerable importance to understand *how* such social processes can lead to knowledge. For example, factors such as the role of

diversity were widely discussed. “Both cognitive and social diversity have similar effects on group deliberation. No diversity, no disagreement, and no critical feedback; but too much diversity erodes trust and mutual understandings and prevents the convergence of opinion” (Pesonen, 2022, p. 14). Rather than seeking sameness, it became clear that knowledge and learning require *difference*.

*Connectivism* was offered in 2004 as an answer to such questions. It at once embraced the role of context, community and interaction in the development of knowledge and learning, and it drew from the unique affordances of digital learning environments to describe how such a process might be implemented. It pushes back at once against the idea of knowledge acquisition through transmission and also against the idea of knowledge as consisting of purely formal, and purely internal, schemas and representations.

In his paper introducing connectivism, Siemens quotes an undated comment from Karen Stephenson to underline the first point:

Experience has long been considered the best teacher of knowledge. Since we cannot experience everything, other people’s experiences, and hence other people, become the surrogate for knowledge. “I store my knowledge in my friends” is an axiom for collecting knowledge through collecting people. (Siemens, 2005)

And he points to the complexities of chaos theory to make the second point:

Chaos is the breakdown of predictability, evidenced in complicated arrangements that initially defy order. Unlike constructivism, which states that learners attempt to foster understanding by meaning making tasks, chaos states that the meaning exists—the learner’s challenge is to recognize the patterns which appear to be hidden. (Siemens, 2005)

In the explicit embrace of an idea of knowledge and learning as embedded in chaos and context, the nature of knowledge is transformed from formal schemas and representations to connections between entities and pattern recognition. Formal representations may continue to be used, and may constitute the *content* of communication, but knowledge and learning are found in the structure and organization that grows around such content. “The learner’s challenge is to recognize the patterns which appear to be hidden. Meaning-making and forming connections between specialized communities are important activities. . .” (Siemens, 2005) leading to the “spontaneous formation of well-organized structures, patterns, or behaviours, from random initial conditions” (Rocha, 1998, p.3).

Connectivism makes these phenomena explicit in the definitions of knowledge and learning. “At its heart, connectivism is the thesis that knowledge is distributed across a network of connections, and therefore that learning consists of the ability to construct and traverse those networks” (Downes, 2007). As a theory of digital learning environments, therefore, connectivism as a theory describes the formation structures and processes that lead to self-organizing networks in education. The first and most important of these is the Massive Open Online Course (MOOC).

Developed in 2008, the “Connectivism and Connective Knowledge” MOOC (CCK08) was intended not only to introduce the theory but also to offer an example

or model of the theory in action (Downes and Siemens, 2008). Rather than being centered around a body of structured content and defined in terms of learning objectives, the MOOC was arranged around a series of loosely defined topics as social networks, intentionalism and meaning, groups and networks, complexity, chaos and randomness. While course organizers offered material in the form of papers, blog posts, and recorded conversations, the course as a whole consisted of the contributions of more than 170 separate blogs or websites; posts from these were syndicated using RSS and distributed to the 2200 participants in an email and RSS newsletter called *The Daily*.

The design of CCK08, while still rooted to a degree in traditional pedagogy (a Moodle environment was employed alongside the blog posts, newsletter, and wiki, and formal assessment was offered to a small group of University of Manitoba students taking the course for credit), was based in what might be characterized as the principle for successful networks (Downes, 2005) and in particular around what came to be called *the semantic principle* outlining four major conditions for successful knowledge creation in self-organizing networks. The first two, *autonomy* and *diversity*, can be seen in many of the earlier theories discussed above. The latter two, *openness and interactivity*, are derived from the development of the digital networks used to support the internet in general and online learning in particular.

Following the development and success of the connectivist MOOC model, e-learning developers and designers began to ask how best to support both learner autonomy and learner diversity, a discussion that led to the articulation of the *personal learning environment* (PLE) as a conceptual design.

Rather than integrate tools within a single context, the system should focus instead on coordinating connections between the user and a wide range of services offered by organizations and other individuals. Rather than interacting with the tools offered within the contexts supplied by a single provider, the PLE is concerned with enabling a wide range of contexts to be coordinated to support the goals of the user. (Wilson et al. 2007, p.5)

No viable commercial product was developed along the lines of the PLE; however, the development of a successor technology, the *learning experience platform* (LXP), may be attributed to the PLE. For example, one contemporary LXP vendor writes that the LXP

is a consumer-grade learning software designed to create more personalized learning experiences and help users discover new learning opportunities. By combining learning contents from different sources, recommending and delivering them with the support of Artificial Intelligence, across the digital touch points, e.g., desktop application, mobile learning app and others. (Valamis, 2022)

The concepts of openness and interactivity were drawn from the example of digital network technology, and most especially, the Internet itself. In addition to the physical properties underlying the Internet that made it a reliable and useful network, properties such as decentralized design and distributed resources, the success of the

Internet was also attributed to open standards and open source software. As Berners-Lee (1989) wrote in 1989,

the hope would be to allow a pool of information to develop which could grow and evolve with the organisation and the projects it describes. For this to be possible, the method of storage must not place its own restraints on the information. This is why a “web” of notes with links (like references) between them is far more useful than a fixed hierarchical system.

It was noticed by many that the structure of the Internet – a digital network consisting of a set of dynamically changing links reflecting the knowledge and learning of a society – and some forms of artificial intelligence – described under the heading of *connectionism* and consisting of dynamically changing links between interconnected artificial neurons reflecting the knowledge and learning of a computer system – were in many important respects the same. Connectivist theory made this association explicit and extended the association to include examples from theories of self-organizing social networks (as described by Barabási 2003, Shirky 2008; Watts 2003) as well as graph theory. The key tenet of all four sets of theories is the same: knowledge is not content, it is *organization*. And as such, connectivism reflects back directly to the concepts of the community of practice and the community of inquiry, where, as noted above, “*knowing* is inherent in the growth and transformation of identities and is located in the relations among practitioners, their practice, the artifacts of that practice, and the social organization and economy of communities of practice” (Lave and Wenger, 1991, p. 122).

Recent work in digital learning environments reflects and builds on these themes. One line of enquiry of note can be found under the heading of *open educational practices* (OEP), which emphasize at once the openness characteristic of learning in digital networks but also the need for a more humane approach based on an ethic of care (Farrow, 2016, p. 100) where the traditional conception of education as “the transfer of information and knowledge to learners is being replaced with a view of learners as active participants in their own learning” (Kaatrakoski et al., 2017). “OEP are defined as practices which support the (re)use and production of OER through institutional policies, promote innovative pedagogical models, and respect and empower learners as co-producers on their lifelong learning path” (Ehlers, 2011, p. 4). Cronin (2017) identifies the following dimensions of OEP: balancing privacy and openness, developing digital literacies, valuing social learning, and challenging traditional teaching role expectations.

Another more recent body of work revolves around the concept of embodied cognition and learning. “Embodied cognition involves how the body and mind work in tandem to create the human experience. Embodied cognition literature suggests that the physical actions we perform, as well as the actions being performed around us, shape our mental experience” (Sullivan, 2018, p. 129). Based on work by, among others, Varela et al. (1991, p. 172), embodied learning also draws from Papert’s theory of constructionism, referenced above, but also builds on the concept of non-cognitivist and non-formal knowledge, as described by Dreyfus and Dreyfus (1980) and Bransford et al. (1999). Shapiro and Stolz (2019) outline “some of the

main ideas that distinguish embodied cognition from computational cognitive science” and argue “traditional cognitivist accounts of the mind should be challenged because they exclude the close relationship that exists between mind and body that is more profound than initially considered”(p. 20).

Similarly, the work of Princeton scientist Fei-Fei Li and her colleagues (Liu et al., 2022, p. 1) points to the development of *embodied AI* as a field involving “AI agents that don’t simply accept static images from a data set but can move around and interact with their environments in simulations of three-dimensional virtual worlds” (Whitten, 2022). It suggests a type of AI that “could power a major shift from machines learning straightforward abilities, like recognizing images, to learning how to perform complex humanlike tasks with multiple steps, such as making an omelet”(Whitten, 2022). The difference here is like the difference between presenting a student with text and images to learn from and giving them a real environment where they can move about and try things. “The meaning of embodiment is not the body itself, it is the holistic need and functionality of interacting and doing things with your environment” (Whitten, 2022).

Also enjoying a renaissance is an approach called *enactivism* which is a combination of constructivism and embodied learning and “is a theory wherein cognition and environment are inseparable, and learning is drawn from the interaction between learner and environment” and “emphasises *emergent* cognitive structures that *self-organize* as a result of interactions between organism and environment” (Ward et al., 2017, p. 368). Again, we see the link not only to connectivism but to other emerging theories of digital learning environments. “Views of the mind as embodied, embedded, extended, affective, or some combination of these, are members of the enactivist family at least in virtue of sharing important common ancestry” (Ward et al., 2017, p. 373).

The definitive theory of digital learning spaces is perhaps yet to be written, but there is a sense in which a sea change has occurred in some areas of educational technology and e-learning, even if the proponents of traditional learning, content-based MOOCs, and cognitivist theories of knowledge have not yet yielded the field. Knowledge and learning are based, minimally, in complex processes. These processes defy simple description and explanation, but at a minimum depend in important ways on one’s environment, whether by engaging in conversation or manipulating objects, and vary significantly depending on context, which may include both the learner’s prior experiences, but also the nature of the culture, workplace or community in which one finds themselves immersed.

---

## What Is a Theory: Revised

In an earlier section of this chapter we discussed the traditional conception of a theory and in particular the HD model that informs much of the common discourse around learning theories in general and those concerning digital learning environments in particular. Such theories, we noted, are based on *explanations* of phenomena such that, with the appropriate intervention and a correct theory, we may reliably

predict a learning outcome. Traditional learning theories were developed within the context of traditional theory. So when we say that key research questions have been answered, what we mean is that researchers have provided *explanations* for learning phenomena such that pedagogical interventions may reliably produce desired learning outcomes. But learning, as we detail in this chapter, is based on complex and context-based phenomena, and cannot be understood in terms of anything like a DN model.

Another way of saying the same thing is to say that humans, and human learning, cannot be subject to *mechanistic* explanation, and therefore, processes and pedagogies based on mechanistic theories of knowledge and learning. It may be that mechanistic processes may reliably produce some or another *outcome*, but the error consists in describing that outcome as “learning.” It is merely a production, an offering of content for the content machine, and not in and of itself indicative of a capacity expressed that can only be developed in a learning community or environment through a process of practice, reflection and interaction.

It therefore merits speculation that what we understand as a “theory” ought to be reflected in, and informed by, what we understand as “learning.” And though there is much more that can be studied and researched in that regard, the recent successes of connectionist artificial intelligences, today known as “deep learning,” is instructive. In particular, we can examine the application of AI to learning environment design that is, *learning analytics*. And we have learned that

at the petabyte scale, information is not a matter of simple three- and four-dimensional taxonomy and order but of dimensionally agnostic statistics. It calls for an entirely different approach, one that requires us to lose the tether of data as something that can be visualized in its totality. . . . faced with massive data, this approach to science — hypothesize, model, test — is becoming obsolete. (Anderson 2008a)

So instead, the *model* – which is now what theories have become – is not so much a set of schemas, ontologies and representations, but rather, a large body of data combined with a description of a learning network such that a characteristic set of weighted connections can be employed to perform useful tasks in complex environments in a variety of contexts. These weighted connections do not “stand for” anything. They constitute a “representation” only in the loosest sense of the word. And the elements of the learning network, consisting of neural-level descriptions of activation functions and thresholds, among other physical properties, describe only the learning environment itself, and not the environment about which it learns. Meanwhile, explanation for the output of the neural network that would enable us to manipulate it and force certain results, defies us.

What, then, do such theories do? Popular accounts of analytics describe four major functions: description, diagnosis, prediction, and prescription (Boyer and Bonnin 2016; Brodsky et al., 2015). A study of contemporary deep learning systems suggests (Downes, 2021) two additional categories may be added: generation (or content creation), and deontology (or identifying what the best, or desired, option may be). It is arguable that, given what we now know about knowledge and learning,

a scientific theory may come to be regarded *just as* a neural network model trained on a data set such that it may reliably perform these six functions. While it would perhaps be *nice* to expect simply causal explanations rooted in deep cosmic laws or principles, it may be that these are simply not forthcoming. The universe might not, after all, be like a machine.

## Abstract

Building on earlier work that identified historical paradigm shifts in open and distance learning, this chapter is concerned with analyzing the three broad pedagogical paradigms – objectivist, subjectivist, and complexivist – that have characterized learning and teaching in the field over the past half century. It goes on to discuss new paradigms that are starting to emerge, most notably in “theory-free” models enabled by developments in artificial intelligence and analytics,

**Introduction**

Successive generations of open and distance learning have often been defined by the most dominant physical technologies of the era (e.g., Garrison, 1985; Moore & Kearsley, 2005; Taylor, 1995). Such technologies provide the most obvious contrasts between distance and in-person learning, and there is no doubt that the inventions on which they have relied have played a dominant enabling – though not determining – role in supporting different ways of teaching and learning. Heydenrych and Prinsloo (2010) question this technology-first perspective, instead calling for a multi-dimensional view that considers communication, pedagogy, and context on at least equal footing. This chapter represents an answer to that call, building on our previously published work over the past decade (e.g., Anderson & Dron, 2011; Dron & Anderson, 2014) in which we have presented an evolving generational model of our own that considers broad trends in *pedagogical* paradigms that have evolved alongside and, often, in tandem with these changing tools. By examining how pedagogical approaches have developed in a complex dance with tools and systems that enable them, we seek to highlight how distance learning pedagogies owe their origins to in-person learning, how this has impacted their development, and how the pedagogical pathways of open and distance learning have increasingly diverged from their in-person ancestors.

---

**Why Do Physical Technologies Not Seem to Matter for In-Person Learning?**

Distance learning relies upon and is enabled by tools – books, postal services, radio, TV, networked computers, etc. – so it is unsurprising that many authors have defined each era of its history through its dominant tools. In-person teaching, though, is at least as dependent on distinctive and ever-evolving technologies as distance learning, from classrooms to electronic whiteboards, yet we do not normally view its history in terms of its dominant tools, even when (such as through the invention of blackboards or textbooks) those tools have been quite transformational. In part this might be because, as Alan Kay quipped, “‘technology’ is anything invented after you were born” (as cited in Brand, 2008, loc. 189), so we simply fail to see them as technologies. It might be due to a slower rate of change in the dominant motifs of

in-person educational systems. *Some* physical teaching spaces have persisted in largely unaltered form for thousands of years, as have *some* of the teaching methods used within them. However, though some dominant motifs – like classes, lectures, curricula, timetables, and so on – have long persisted, there have been massive upheavals in both process and tools, so that can only be part of the story. In part it might be that the diversity and range of technologies used for in-person teaching mean that few are perceived as being particularly dominant, albeit that classrooms, blackboards, and textbooks, for instance, clearly *have* dominated over lengthy periods.

We suspect that the biggest reason for the relative insignificance of tools in defining generations of in-person learning might be that, beyond language, writing, and drawing, very few of its physical technologies are essential. For learning in a classroom, you could often take away almost anything apart from a teacher and students, including the classroom itself, and it would still be recognizably the same thing. Without the media and tools that enable distance teaching, it would not occur at all.

From a naïve perspective, new technologies of in-person learning are typically introduced into an already well-established system rather than changing the system itself. The tools are usually incrementally better ways of addressing the same problems, and their significance is usually limited because they seldom change structural components of the overall system. This helps to entrench a widespread belief that pedagogy must come first (e.g., Chumley-Jones, Dobbie, & Alford, 2002; Nation & Evans, 2000; Wilkinson, Forbes, Bloomfield, & Fincham Gee, 2004).

---

## Generation 0

While *pedagogy* (in the sense of being the art and science of teaching) underpins all our teaching interventions and is the *purpose* of what we do, *pedagogies* (by which we mean methods of teaching or instructional methods) *never* come first. There are countless other technologies (from curricula to timetables to classroom architecture) that impose limits and create problems that pedagogies must solve. Most of these are prior to pedagogical methods and provide a foundation upon which pedagogies are utterly dependent. Novel technologies can, in solving such problems, create new ones of their own, so the system evolves. As Postman (2011) put it, all technologies are a Faustian bargain, where each problem solved results in new problems caused by the solution. For example, the introduction of blackboards in the nineteenth century changed how teachers could teach. They could draw, provide shared notes, provide structure and emphasis to lectures and discussions, capture student ideas, and so on, in ways that were difficult, expensive, or impossible before. However, blackboards also created many new problems, from diverting the teachers' gaze from the class to issues of teacher competence in drawing and writing, to required changes in pacing, to concerns for students with reading disabilities. Blackboards thus often required teachers to invent counter-technologies (Dubos, 1969) to deal with them. It is possible to see similar patterns in every teaching innovation, including familiar

inventions like lectures, classrooms, courses, faculties, and universities. Pedagogical methods evolve in a specific context in which they solve new problems and take advantage of new opportunities.

### **The Problems that In-Person Learning Has to Solve**

Perhaps the most fundamental problem that an in-person pedagogy has to solve is motivation. In-person teaching (at least in its paradigmatic lecture form) must grapple with the fact that few students will want to be there all of the time, and it is really difficult to sustain everyone's interest when they do attend. Self-determination theory posits that, for intrinsic motivation to occur, support must occur for autonomy (students must feel in control), competence (students must feel capable of overcoming meaningful challenge), and relatedness (students must feel that there is social value and meaning in the activity) (Ryan & Deci, 2017). In-person teaching easily supports relatedness. However, especially in its raw full-frontal lecture form (that originally solved problems of the scarcity of books and reading skills), it is inevitable that some will feel insufficiently challenged (bored) and some will feel over-challenged (confused). Students will not experience autonomy because the nature of classroom activity means that the teacher must be in control of every second. Some of the most common solutions to these problems just make them worse. Notably, the use of extrinsic rewards and punishments such as grades and gold stars, though achieving some kind of motivation (in the sense of encouraging students to comply with teachers' demands), reliably and persistently inhibits intrinsic motivation (Deci, 1972; Gneezy & Rustichini, 2000; Kohn, 1999). Most of what we nowadays recognize as good pedagogy aims to at least partially address the lack of autonomy and inappropriate level of challenge of the in-person context. Problem-based, discussion-based, project-based, and similar individualized/group approaches, for instance, allow greater student control, including more control over the pace and level of challenge. Textbooks allow greater freedom to study at a pace more suited to the learner. Lecturers who enthuse, who ask questions that intrigue students, who seek to know their students so that they can make connections with their interests, and so on are dealing with these issues, as are those who take advantage of the inherent social nature of the situation by encouraging discussion or just by remembering every student's name. Though some of our pedagogies are appropriate to all learners, regardless of their motivation, many of those that characterize classroom teaching are inventions and techniques that solve problems created by classroom teaching.

### **The Problems that Distance Learning Has to Solve**

Evolution in the field of distance learning has occurred, at least in part, due to the affordances and constraints of new technologies. These have, in ways that have seldom been so profound for in-person learning, repeatedly changed the sorts of

problems that distance pedagogies must solve. From a motivation perspective, these are (in principle) largely the inverse of those faced by in-person learners. With few exceptions, distance learners almost always have more autonomy because a teacher is not determining what happens every moment. Students are also far better able to control the level of challenge, because they can reread, rewind, or seek alternative sources for their learning. Relatedness, however, tends to be harder to support because all communication must normally be intentional, focused, and mediated through further technologies, often with limitations on cues such as voice intonation, body language, and touch.

However, the discipline of distance education has grown up in the context of its ancestor, in-person learning, and must often coexist and interoperate with it. Often, teachers who have learned to solve problems in in-person learning bring their expertise – and their assumptions – to the distance context. The same is often true of distance education students, who have nearly all grown up with in-person learning and the problems that it has to solve, which leads to expectations that distance institutions and teachers are expected to meet. Unfortunately, this means that distance learning has inherited many of the problems of its forebear, including assumptions about teacher control and the need to extrinsically motivate students, mainly through examinations, grades, and credentials, with all the damage to intrinsic motivation that this entails. Only recently has this begun to shift. With this in mind, we move on to describe how distance education has evolved over the past 50–60 years.

---

### **The Three Generations of Distance Learning Pedagogical Paradigms: Objectivist, Subjectivist, and Complexivist**

In our previous work (Anderson & Dron, 2011), we described the evolution of pedagogies in distance education as falling into three fairly distinct generations – the behaviorist/cognitivist, the social constructivist, and the connectivist – each of which was codetermined not just by developments in pedagogical knowledge but by changes in the affordances and constraints of the information and communication technologies that emerged during each period, as well as other systemic factors. No generation replaced any that preceded it, and all survive to this day. We also speculated about what form the next generation might take, predicting that it might be more holistic, incorporating elements of them all. In this section we will return to this model, presenting a revised and refined version that takes into account developments – including in our own understanding – that have occurred since our original work.

The names for the generations that we originally chose were clumsy and over-specific. The behaviorist/cognitivist generation also included instructivist approaches informed by neither behaviorism nor cognitivist models, the social-constructivist generation included much that was either not very social or not particularly constructivist in its underpinnings, while the connectivist generation emerged nearly two decades before the advent of the named theory of Connectivism and included many

models and theories that at least one of Connectivism's creators has explicitly disowned. It is also easy to confuse connectivism, the paradigm, with Connectivism, the theory. On reflection, we now prefer to refer to them as the *objectivist*, the *subjectivist*, and the *complexivist* generations, which more concisely characterize the central differences between them, as explained in more detail below. However, they still denote the same basic concepts.

## Objectivism: A Paradigm of Teaching

The objectivist paradigm, as the name implies, involves pedagogies that assume both that there is an objective reality to learn about and that there are clearly defined objectives to be achieved. There are two broad psychological models underpinning this paradigm. The first (behaviorist) focuses on ways to bring about terminal behaviors. The second (cognitivist) focuses on the ways that people are believed to learn, in terms of internal cognitive processes. There are many theories and resultant practices of learning and teaching in both approaches. Both behaviorist and cognitivist models have a clear focus on *teaching*, trying to identify and predict the ways that teachers may most effectively bring about learning of the desired skills or knowledge, and both therefore focus mainly on instruction (and, hence, are often referred to as instructivist approaches), although the principles they entail – such as spaced learning (Fields, 2005), direct instruction (Stockard, Wood, Coughlin, & Rasplia Khoury, 2018), or media mixing theories (e.g., Clark & Mayer, 2011) – may also be of value when learning is self-guided. Before widespread availability of affordable two-way or multi-way communication technologies, an objectivist approach was the main pedagogical paradigm available to distance educators. Telephones, two-way radio, occasional meetings at learning centers, fax machines, and other alternatives have been available for decades, and letters have been an option for many centuries. However, all had limitations in cost, speed, reliability, or range that made their widespread or ubiquitous use problematic. By far the shortest path for the bulk of the learning process itself was, for the teacher, to provide instructions on how to learn and, for the learner, to follow those instructions independently. At least, that was the paradigm. In reality, learners rarely followed such instructions to the letter (Haughey & Muirhead, 2005). Additional pedagogies used by the learners themselves in their homes or offices were seldom observed, because they could not be observed.

The objectivist paradigm evolved over the course of a century or so, starting with newspaper instruction lacking much theoretical basis at all. However, it was only in the 1960s that pedagogical theory and practice began to emerge into the mainstream that was distinct from its in-person cousins. By far the most significant developments in this era were in the systematization of the pedagogical and organizational processes employed, much of it stemming from the work of Charles Wedemeyer (Diehl, 2012), whose analysis of the components of the teaching process enabled it to be reinvented in a form that could be orchestrated with available technologies to produce measurable outcomes that closely resembled those of in-person teaching.

The field advanced through the work of Otto Peters (Peters & Keegan, 1994) who developed and promoted an industrial model of education, in which different teaching roles were assigned to different team members (editors, subject matter experts, media production staff, artists, and so on) to create carefully crafted content, combined with a process model that typically involved interaction with tutors who supported these courses to provide personal support akin to that of a conventional teacher. This industrial model was extremely scalable and provided the foundations needed for the formation of most open universities, such as the Open University in the UK, Athabasca University in Canada, Indira Gandhi National Open University in India, and many others in Turkey, China, and elsewhere. These new distance universities often enrolled vast numbers of students. Currently, IGNOU, Anadolu, and the Open University of China each enroll over a million students a year, but even smaller institutions see the benefit of scale. It is significant that not only were these distance universities but they were also open, meaning that many of their students lacked formal qualifications or experience, unlike the highly selective models of the vast majority of conventional universities. Again, this was heavily influenced by technological factors. On the one hand, in-person universities suffer from problems of finite space and location dependence that inherently limits their enrollment capacity, so selective filtering is as much a necessity as an aspiration. On the other hand, traditional in-person universities that demand attendance are simply not an option for many nonconventional learners with jobs, families, or physical constraints on attendance. Though completion rates were (and often remain) lower than their in-person cousins, the fact that the unfiltered students of open universities achieve similar if not greater measured learning outcomes to those of highly selective in-person institutions suggests that the methods work. At least part of the reason for this might be that the freedoms – especially in autonomy and competence – that they offer make it possible for students with far more diverse abilities and experience to thrive, without the need to remain in lockstep with other students, utilizing their own learning skills, without being hampered by sometimes poor or controlling teachers.

## **Subjectivism: A Paradigm of Learning**

*As the name implies, the focus of the subjectivist paradigm is the subject: the learner. Subjectivist theories acknowledge that learning is a subjective process in which knowledge is constructed in the context of existing knowledge. There are two main models in this paradigm, the cognitive constructivist and the social constructivist. The cognitive constructivist model, epitomized in the work of Piaget (1970), focuses on how knowledge is constructed by individuals. The more influential social constructivist model, which builds on the work of Dewey (1938) and Vygotsky (1978), sees construction of knowledge as both an individual and a shared process, in which not only is individual knowledge constructed with, for, and through others, but knowledge itself is perceived as a social and situated phenomenon. The focus of subjectivist models is on how we know and how we come to know: these are not*

*theories of teaching, as such, but of learning. They do not dictate any particular method, though they do imply that some approaches – especially those that involve social interaction, open-ended tasks, and active engagement – will be more promising than the typically instructivist approaches of objectivist models.*

Subjectivist approaches to teaching gained support in traditional education throughout the twentieth century, but the limited opportunities for learner-teacher or (especially) learner-learner interaction that could be supported through communications tools of the time made it difficult to implement for distance learners. Some – such as the School of the Air in Australia – managed something like it through the distribution of two-way radio sets to learners. Others – such as many of the open universities – relied on sporadic in-person get-togethers to support such needs. The costs, however, were high, and thus such models also relied heavily on print publication, recorded TV lectures, or similar one-to-many tools to provide much of the content and process, so they began as hybrid pedagogies that concatenated objectivist and subjectivist models at different times.

The advent of the Internet and, especially, the World Wide Web brought subjectivist approaches into the mainstream. Suddenly it became possible to learn at a distance with others, in ways that closely resembled those of in-person institutions, at low cost, with broad and often global reach. Due to network speeds and costs of connection, real-time teaching using audio and/or video tools and that closely replicated in-person classroom teaching remained on the fringes for a long time, allowing a distinctive set of pedagogies to be invented to address the asynchronous context. A wide range of research-backed theories and models emerged from this, such as communities of inquiry (Garrison & Anderson, 2003), transactional distance (Moore, 1993), and curated or shared web explorations (Furuta, 2000). It is notable, however, that this paradigm emerged from and into a traditional teaching context in which distance institutions had to replicate many of the central features of in-person learning that, it will be recalled, emerged in response to the limitations of physics and organization in a physical world. Though subjectivist pedagogies acknowledge that every learner will learn something different, and in different ways, their context of application remains firmly rooted in the institutional paradigms of mediaeval universities. Subjectivism focuses on collaborative processes to support shared but largely teacher-led goals, and though its emblematic view of the teacher is that of a “guide on the side” rather than a “sage on a stage,” the role of the teacher is as leader of a named group of students, who retains control, who assesses student learning, and who establishes and enforces group norms and rules.

## **Complexivism: A Paradigm of Knowledge**

The complexivist paradigm goes further than the social constructivist paradigm in seeing knowledge as non-negotiably distributed, situated, complex, and emergent. Learning must, by necessity, inherit the same characteristics, and the knowledge that results does reside not only in the heads of students but also in the networks of both individuals and the physical or conceptual artifacts they create. Complexivist

theories posit that individual knowledge cannot be neatly separated from the knowledge of others and that our minds are not just phenomena emerging in the brains but are extended and instantiated in the world around us; that learning is an inherently complex, unrepeatable phenomenon, always including emergent as well as planned consequences; that learners must be active agents, in control of their own learning; and that connections between what we learn matter as much as or more than what they connect. The term “complexivist” was coined in an educational context by Davis and Sumara (2006) as a means to describe a sensibility towards the world informed by complexity theories and models, through which “the named learner can be considered simultaneously a coherent unity, a complex of interacting unities, or a part of a grander unity” (p. 14), though the educational use of theories and ideas drawn from complexity science went back a decade or two before (e.g., Brown, Collins, & Duguid, 1989; Pea, 1993; Wenger, 1998). However, the archetypal complexivist model is Connectivism, building on the work of Siemens (2005) and Downes (2008), which drew mainly from network theories and models extending from social network theory to connectionism. Complexivist models are concerned with how knowledge emerges in individuals and populations, so seldom dictate ways to teach though, again, some methods, such as open sharing of the process and products of learning, are strongly implied, and many methods are frowned upon as imposing too much structure and order on a complex system. That said, any kind of learning event can be treated as part of the complex whole, including formal lectures and discussions within a course-bound community of inquiry, and most contain within them much that is complex, unpredictable, and emergent. However, while instructivist and subjectivist accounts normally treat these events as the sum total of the instantiation of the pedagogy, complexivists recognize them as only one complex component in a far more complex ecosystem of learning.

Complexivist pedagogies are digitally native, for two main reasons. The first is the enormous scale yet relatively low cost of information and connections to others that is enabled by the Internet, especially in supporting one person sharing with many. The second is that interactions and outputs of learning are reified persistently, allowing learners to participate in the learning of others for years or even decades after the initial interactions occurred. This speaks to the “complex” part of the name because, through such reified interactions, the environment for learning itself is constantly transformed. Unlike the earlier subjectivist and objectivist models, complexivist approaches are not rooted in the classroom, albeit that a complexivist view of classroom learning can have value (Davis & Sumara, 2006). From a complexivist viewpoint, teachers may play important roles in the network, especially as role models and sources of wisdom, but they are not so much guides on the side nor sages on stages as they are co-travellers, part of a complex matrix of interacting agents who learn together, in a broader networked context that extends far beyond that of a defined, goal-focused group.

Among the most notable benefits of complexivist models of learning come from the fact that, far more than subjectivist models, they solve the problems of learning that in-person pedagogies sought to address, *without* the problems caused by a reliance on the physical infrastructure that in-person pedagogies had to solve. Online

learners do not have to follow the same pace as others, keep the same time, or follow the same paths, and they do not have to relocate in order to learn. Meanwhile, they benefit from many of the advantages of social interaction that classrooms support, as well as new affordances enabled by the vast numbers of people with whom they might interact, at any time of day, in any place, with any degree of personal involvement that suits them, at times and places far beyond the classroom. In previous work, building on Paulsen's (1993) theory of cooperative freedoms, the authors (Dron & Anderson, 2014) identified ten distinctive realms of freedom that may be potentially available to online learners that are, without complex and demanding pedagogical processes, rarely available to their in-person counterparts:

- Place – where learning happens
- Content – what you learn and where you learn it from
- Pace – how fast you learn it
- Method – the pedagogies you use and how you are assessed
- Relationship – who with and how you relate to others
- Technology – what tools you use
- Medium – what form media take
- Time – when you learn
- Delegation – who dictates what happens next
- Disclosure – what you reveal to whom

Unlike previous generations, complexivist models natively extend beyond formal learning and intentional training, seamlessly blending into our living and working lives. From Google Search to LinkedIn, from MOOCs to Wikipedia, an increasing amount of our knowledge is enabled by and embedded in the digital environment around us, and we are not just consumers but producers of it, from simple chats in social media to full-blown blogging sites and shared videos. The inevitable increase in complexity of technologies and culture that drives us into an ever-expanding adjacent possible requires us to learn continuously throughout our lives – what Barnett (2011) calls “life-wide learning.” Digital tools and systems are both means and co-participants in this. Increasingly we learn just in time because the skills we need would have become redundant by the time we had taken a traditional program of study, and our tools play an ever greater role in our cognition, supporting, enabling, and storing what we know, often reified and expanded in connections and conversations with others.

## **Blurred Lines and Overlaps**

Although we first presented these as distinct generations, the reality of the lived learning experience is and has always been that all generations coexist in any learning journey of any length or complexity. Though only recently recognized, complexivist learning has always occurred in classrooms and families and especially for distance learners who, at least as much as campus-based students, learn in a social

space with others, influenced by many people and many things. Even the most full-frontal behaviorist teaching in a classroom is mitigated by the fact that students live much more of their lives outside it, and complex things can happen within it. Furthermore, none of the generations excludes the possibility of the others. The most free form of complexivist networks still relies on individuals constructing knowledge in a social context and on content that is intended (and sometimes designed) to support ways of learning informed by cognitivist theories. There are even times when behaviorist methods can be useful in otherwise far less structured ways of learning, from actors learning their lines to children learning to ride bicycles. Each provides a perspective and tools. Though there are overlaps, each sees and treats education as a different problem to solve, taking advantage of available phenomena to achieve that. None provide a definitive solution to all learning problems.

---

## Emerging Paradigms

Beyond these three existing paradigms, new models of open and distance pedagogies are emerging. In this section we discuss three of the more significant of these.

### Data-Driven Pedagogy: A Theory-Free Paradigm

Cloud-based learning management systems, MOOCs, and similar tools that farm data from massive numbers of students can use such data in an attempt to understand and often to influence the learning process. Educational data mining and learning analytics systems seek patterns in datasets that provide clues about how students are learning, often relating them to intended learning outcomes (in the objectivist tradition) though sometimes to explore other aspects of behavior, such as social engagement or self-directedness. Often, such as in adaptive systems like Knewton (Wilson & Nichols, 2015), the data are used to provide recommendations about how to learn, based on how others have done so, not (like traditional adaptive hypermedia) based on teacher-specified paths, but on the interactions of countless other learners with the resources and one another. The pedagogical underpinnings of these recommendations are often opaque to even their creators as patterns mined from the crowd come to dictate how and what we learn and who we learn from.

These invisible, “theory-free” pedagogies are not neutral but goal driven: machines are trained to seek specific outputs and patterns, even though the paths to reaching them may be unknown. When those outputs are credentials or grades, they are seated firmly within the objectivist paradigm and to a large extent to the behaviorist end of the spectrum, where what matters is not how learning occurs, but what results are achieved. However, similar tools can be trained to seek more than just teacher-determined learning outcomes. For example, Joksimović et al. (2015) have used learning analytics methods to explore patterns of social capital development in MOOCs, while Gašević, Dawson, Rogers, and Gašević (2016) have used

learning analytics to analyze the effects of instructional design on learning behaviors, as well as to mine for student learning strategies (Gašević, Jovanovic, Pardo, & Dawson, 2017).

There are risks that, whether through algorithms or training sets, such systems intentionally or unintentionally embed values and assumptions of their creators and may create filter bubbles (Pariser, 2011) or echo chambers (Dubois & Blank, 2018) that reinforce ineffective pedagogies or falsehoods. The goals of the system are determined by the means of measuring success, and these will, in most cases, fail to recognize what they are not trained to seek: the creative, the tangential, and the expansive outcomes that a human teacher could celebrate. There are therefore risks that systems will lead to “good enough” ways of learning that fail to stretch learners’ boundaries. Artificial “intelligence” is often anything but intelligent, because, until artificial generalized intelligence is achieved (which, in the opinion of the authors, may be never), it never can understand what it means to be human, the values, the beliefs, the culture, the motivations, and the meanings that education, in its broad sense, seeks to develop.

Though the field is young and much of it is dominated by the objectivist paradigm, it affords the potential for the development of data-driven pedagogies that have no paradigmatic underpinnings. Much as Google Translate embodies no rules of grammar or syntax, and has no understanding of the meaning of the sentences it translates, yet achieves functional results, so will AI-embodied pedagogical agents teach without understanding or caring how their pedagogies work, measuring success by goals they have been trained to measure, with no knowledge of other effects, the contexts and needs of the learners, nor the value of what they do.

## Hologology: A Cultural Paradigm

The term “hologology” has been defined to describe ways of learning to be a part of a culture with shared values and practices (Cumbie & Wolverton, 2004), though largely as an extension of the subjectivist paradigm in an in-person setting. At its heart is a networked-individualist (Wellman, 2002) view of humans as individual agents, becoming part of a culture, that Cumbie and Warburton describe as a pedagogical process of identifying, connecting, relating, becoming, and joining as they learn together. To a significant extent, education is concerned with the transmission and development of culture. As education becomes more global and the dominance of Western culture recedes, the networked individualist perspective that underpins subjectivist and complexivist paradigms is being challenged. We belong not just to networks and groups but to *sets* with which we identify (Dron & Anderson, 2014) such as nations, genders, age groups, or adherents to belief systems. We expect to see the development of distance pedagogies that more clearly acknowledge the many tribes and other identity-defining sets to which we belong. Such pedagogies recognize that learning is not just about the person or their immediate network, but the rich, complex, and meaningful ways that we belong to and contribute to multiple interlocking and distributed cultures. Such issues have

historically been addressed by the “hidden curriculum” of in-person teaching – for instance, ways that teachers address problems and invite students into the cultures of disciplines – but play out in different (though no less significant) ways at a distance (Anderson, 2001). This is an emerging paradigm with, as yet, relatively little explicit underpinning pedagogical theory about how it may be supported in an open and distance setting.

### **Bricolage: A Theory-Agnostic Paradigm**

The wealth of pedagogical paradigms available to us makes it possible to think of learning as a process of bricolage, selecting the most appropriate pedagogical models for our current needs from the many available options. More and more learning is about charting (Littlejohn, Milligan, & Margaryan, 2012) and wayfinding (Siemens, 2012) in a cornucopia of information, competing values, and incompatible world-views where we are members of not one society but millions of fragmented sets, networks, and groups. Pedagogically, the challenge is not one of integrating, constructing, or knowing, but of being able to know what is worth knowing, and how best to learn in the whitewater world of conflicting ideals and opinions. We see the increasing need for critical and reflective approaches to *choosing* pedagogies (by both students and teachers), more than how to learn *using* those pedagogies, as a distinct pedagogical challenge in itself. From this perspective, pedagogical methods and paradigms are just tools among many in a tool chest. There is a need for learning how to choose the right tools and how to assemble and orchestrate them most effectively in different contexts. Though lessons can be drawn from the field of critical pedagogy (Giroux, 2020), complexivist accounts, and the discoveries of the emerging theory-free paradigm, this theory-agnostic approach may become a paradigm in itself. We hereby christen this bricolage-based approach “bricolage.”

---

### **Conclusions**

Among the positive outcomes of increasing globalization and connection is increasing recognition that we share a common global environment, that there are different ways of learning, different ways of knowing, and different ways of acknowledging competence. The blends and hybrids that result can make all stronger. The risks of truth denial, though, are great when multiple truths are embraced with equal fervor, regardless of internal validity or consistency, or social or ethical foundation. Much of the time, rather than combining or inspiring one another, the egalitarian nature of the Internet separates and polarizes. This is a better alternative, perhaps, than the non-egalitarian approach that is increasingly seen in different nations, where decisions about what can be seen or how we can participate within a digital environment are often made by totalitarian governments. Both alternatives have consequences that demand the invention of counter-technologies, including pedagogies. No longer (if it ever was) can education be seen solely as the passing of wisdom from one

generation to the next, nor as a stabilizing social force that maintains and/or evolves a culture, let alone (as some would have it) as a feeder to business, though powerful forces will conspire to retain these (often competing) roles. Acolytes celebrate the efficiency and effectiveness of large-scale, automated, deeply instructivist learning systems that rely on AI for their effectiveness, and, in fairness, they do bring “education” – in the sense of an opportunity to gain credentials – to many who could only have dreamt of it before. In the process they inculcate the outcomes and values chosen – sometimes unwittingly – by their creators and converge ever closer to an average norm, as data-driven approaches that treat humans as vectors on a graph replace human mentors, guides, and supporters. Chatbots that pretend to be human play an increasing role in the educational process not just as a better form of automated help but as entities that give students a sense of belongingness and being cared for (Eicher, Polepeddi, & Goel, 2018), thus learning values embedded by their creators that represent humanity only in caricature. We learn to be human from the examples and recommendations of machines.

We foresee a fragmented future of increasing diversity, where paradigms rarely blend but instead compete for the ever more valuable attention of those seeking to learn. The powerful *will* succeed: we will see the robot-taught and goal-driven big-data-based variant of the objectivist paradigm become ever more successful, competing more and more with traditional institutions and, often, being embraced by those institutions as essential to a viable future where economic constraints make traditional roles less affordable. Powerful group- and identity-based hologogic learning that stresses affective commitment and belonging, some driven by echo chambers and filter bubbles, will also thrive. Finally, we see the growth of theory-free approaches as inevitable. These pedagogical designs will become the remit of machines that have no intrinsic care for the needs of people and their communities.

Compensating for this arguably dystopian trend, the powerless will become – collectively – more powerful, despite and perhaps in reaction to the dominant players, be they political, commercial, or ideological. We will learn more together, through what we share, and we will learn to share more wisely, more capably, more respectfully, and more openly. It is notable that, despite the very well-reported dominance of a few huge players in social media, independent WordPress sites still constitute more than 40% of all publicly accessible websites (<https://w3techs.com/technologies/details/cm-wordpress>, accessed June 1, 2021). These sites are all independent but networked, and a fair proportion of those are devoted to learning or teaching, whether formally or not. Just as increasing numbers of people are turning away from algorithmically determined sites and systems of the large corporates, so they will resist the invasion of machines in the educational process. Learners will not be products but producers, valued parts of a human collective that teaches, learning to learn in ever more diverse ways.

We stand at a very diffuse, fuzzily bounded junction where many pedagogical paths can and will be taken. There is not one dominant pedagogical paradigm emerging in this complex maze, but many.

### Abstract

Motivation instigates and guides learning in open, distance, and digital education (ODDE). It is indispensable to distance learners' engagement, persistence, and achievement. A lack of motivation is associated with perennial issues such as early dropout and poor performance in ODDE. This chapter provides an introduction to key theoretical perspectives on motivation, including sociocognitive theories, sociocultural theories, and the concept of *perezhivanie*. Each perspective provides a unique way for understanding and researching motivation in open and distance learning (ODL). Motivation is discussed as personal attributes internal to the distance learner from a sociocognitive perspective. Drawing attention to social processes and contextual influences, sociocultural theories situate motivation in relevant contexts and highlight motivation as a social, interactive, mediated, and evolving construct. The concept of *perezhivanie* gives prominence to distance learners' learning experiences and subjective meanings they derived

from personally significant experiences in ODL. This perspective pinpoints motivation that is experiential, reflective, and affect-laden. To advance the goal of empowering distance learners to engage and persist in ODL, these theoretical perspectives are important as they underscore empowerment derived from enabling personal attributes (sociocognitive theories), motivating contexts (sociocultural theories), and personally significant experiences (perezhivanie).

## Introduction

Motivation refers to states and processes, internal to the learner or originating from the social realm, that energize, direct, and sustain actions toward a valued goal (Nolen, Horn & Ward, 2015; Pintrich & Schunk, 2002). Motivation is important for open, distance, and digital education (ODDE) because it instigates engagement and promotes learning and achievement (Cho & Heron, 2015; Semenova, 2020; Vayre & Vonthron, 2017). It draws attention to open and distance learning (ODL) as goal-directed activities and offers answers to questions regarding why and how learners engage in ODL. Motivation is especially important for ODDE because distance learners can easily feel isolated, lonely, and helpless during the protracted journey of learning, despite improved interaction enabled by advanced computing technologies. It is hard to imagine that an unmotivated learner is able to persist and remain committed during the extended process of ODL. Expectedly, the critical role of motivation in ODDE has long been recognized as “a necessary pre-condition for distance education” (Cropley & Kahl, 1983, p. 31).

The purpose of this chapter is to provide an introduction to the key theoretical perspectives on motivation that have informed or have the potential to inform motivation research in ODDE. It is beyond the scope of this chapter to offer a comprehensive review on motivation research and associated theories in ODDE. According to Ng (2019), most of the published studies on motivation in ODDE emerged after 2000. These studies were predominantly conducted using sociocognitive theories of motivation. Given the importance of this bulk of research, this chapter starts with a discussion of sociocognitive theories of motivation that conceptualize motivation as personal attributes internal to the distance learner. This is followed by a discussion of sociocultural theories that give prominence to social processes and contextual influences affecting motivation in ODDE. Extending this sociocultural discussion, this chapter goes on to argue that research attention is required to examine distance learners’ learning experiences in ODDE as an important way to understand their motivation. To this end, the Vygotskian concept of perezhivanie (Vygotsky, 1994) is adopted, which is understood generally as emotional lived experiences (Blunden, 2016). The concept of perezhivanie has the

potential to improve our understanding of distance learners' experiential motivation, as it anchors learning experiences in emotionally charged moments or episodes and offers an understanding of distance learners' motivation as dynamic interplays between personal attributes and social influences derived from the ODL context and other relevant social realms (cf., Ng & Renshaw, 2019).

---

## Motivated Learners: Empowering Attributes

Sociocognitive theories define motivation as mental states and processes, such as “attributions, perceptions of competence, values, affects, goals, and social comparisons” (Pintrich & Schunk, 2002, p. 20), which is different from earlier conceptualizations that consider motivation as needs (McClelland, 1963), drives (Hull, 1943), or reinforcement (Skinner, 1971). Motivation, from a sociocognitive perspective, is therefore located in the mind of an individual. Aligning with this individualistic perspective, context is considered as a background variable for understanding personal motivation, and contextual influences are interpreted based on perceptions. Sociocognitive theories differ from each other in relation to targeted mental processes, hence leading to the development of a list of motivational models highlighting facilitating beliefs, goals, values, and strategies that enable learning motivation.

Sociocognitive theories on motivation empower distance learners in several ways. First, sociocognitive theories enable a multifaceted view of motivation, maintaining that learners can be motivated in multiple ways (Ng, 2019). An important research task is to locate and examine different cognitive enablers that facilitate distance learners' motivation and develop effective practices to promote them (Pintrich & Schunk, 2002). Second, sociocognitive theories consider learners as motivated agents capable of managing resources and regulating their actions to produce intended outcomes aligned with their motivation (Bandura, 1997). This position fits in with the conception of self-directed learners widely held among distance educators (Garrison, 2003). Third, while motivation is located in the mind, motivation is not static or fixed and should be considered changeable (Lee, 2015). In other words, distance learners' motivation may vary across context and over time. This theoretical position underscores the importance of developing and verifying ODL designs and practices to support distance learners' malleable motivation.

In what follows, four cognitive enablers, i.e., self-efficacy, achievement goals, intrinsic motivation, and self-regulation, that have attracted much research attention among distance education researchers are described (Ng, 2019). Conceptually, these cognitive enablers highlight motivation as beliefs (self-efficacy), reasons (achievement goals), values (intrinsic motivation), and strategy use (self-regulation).

### Self-Efficacy

Self-efficacy is an individual's task-specific beliefs concerning “one's capabilities to organize and execute courses of action required to produce given attainments”

(Bandura, 1997, p. 3). Self-efficacy determines effort expenditure, goal setting, and persistence in facing challenges (Bandura, 1997; Vayre & Vonthron, 2017). It is considered a powerful predictor of learning and achievement (Pajares, 1996). Given its significance to learning, other motivational models, such as those included in the discussion below, have incorporated perceived competence in their formulations. In the context of ODDE, self-efficacy is critical because feeling efficacious is important for dealing with challenging tasks, regulating learning, and maintaining persistence. In relation to online learning, distance learners need to feel efficacious at using the Internet and online technologies and interacting with instructors and classmates (Tsai, Cho, Marra, & Shen, 2020) in order to gain benefits from using advanced technological tools for learning and interacting with others. Otherwise, distance learners may feel anxious which may jeopardize their ongoing participation in online settings. Most importantly, self-efficacy is a strong predictor of distance learners' performance (Puzziferro, 2008). It is also a predictor of a variety of adaptive responses and actions including persistence, engagement, satisfaction, and course completion (Vayre & Vonthron, 2017).

Promoting self-efficacy requires the provision of abundant opportunities for distance learners to experience success. How such opportunities can be designed and offered is undoubtedly a priority research topic in ODDE. To do this well, the issue of conceptual clarity needs research attention, as there are studies (e.g., Tladi, 2017) that have deviated from the task-specific conceptualization of self-efficacy. Further effort is required to examine self-efficacy at a finer grain size in relation to specific tasks central to ODL. For example, completing an assignment in an ODDE course involves a list of specific tasks related to comprehending distance learning materials, interacting with others, and regulating the writing process whereby self-efficacy for each task can be assessed. In the context of online learning, Tsai et al. (2020) provided a research example assessing different dimensions of online self-efficacy, including completing online courses, using online technologies, interacting with the instructor, and interacting with classmates socially and for academic purposes. Furthermore, additional effort is required to examine distance learners' changing beliefs in self-efficacy over time and the factors that have triggered such changes (Lee, 2015).

## **Achievement Goals**

Achievement goals refer to students' perceived goals or reasons for learning and achievement (Dweck, 1986). In the past three decades, achievement goal research has focused predominantly on two categories of goals, i.e., mastery goals and performance goals. Mastery goals orient students to learn for the sake of improvement and comprehension; performance goals, however, orient students to focus on achievement and ability comparison. Achievement goal researchers (e.g., Harackiewicz, Barron, & Elliot, 1998) have elaborated approaching and avoidance orientations of these two categories of goals, resulting in a  $2 \times 2$  conceptualization comprising mastery-approach, mastery-avoidance, performance-approach, and

performance-avoidance goals. Remedios and Richardson (2013) verified this quadruple framework based on a study of British distance learners who rated mastery-approach goals as the most important goal. Convergent evidence supporting the importance of mastery-approach goals for distance learning has been reported in other studies (e.g., Cho & Shen, 2013; Ng, 2017, 2018), confirming that a mastery focus is highly motivating and closely related to self-efficacy beliefs and the use of self-regulatory and learning strategies. Nevertheless, the extent to which performance goals can be beneficial to learning and achievement is a major point of contention in achievement goal research. Accumulated evidence has shown that performance-approach goals bring motivational benefits to learning and achievement, leading to a call for the endorsement of performance-approach goals alongside mastery-approach goals (Harackiewicz et al., 1998). Therein, some studies in ODDE (Ng, 2017, 2018; Remedios & Richardson, 2013) have provided empirical support to the benefits of simultaneous adoption of both mastery- and performance-approach goals in ODL.

Thus far, few researchers have examined how achievement goals operate in online environments such as MOOCs and blended learning courses (see Cho & Shen, 2013). In addition, it is likely that distance learners may learn for reasons other than mastery or performance considerations. For example, personal development and career considerations are important reasons for learning in ODDE (Ng, 2018). It is important to examine these additional reasons and their motivational effects on beliefs, strategy use, and performance following the achievement goal conceptualization. Furthermore, future research should adopt qualitative methods, such as interview, to examine distance learners' reasons or goals for learning, as survey designs, the dominant method in the extant literature, constrain distance learners' responses to predetermined categories in a questionnaire. Given the motivating effects of mastery-approach goals, it is important to explore how a mastery focus can be instigated in ODL designs.

## **Intrinsic Motivation**

Intrinsic motivation refers to engaging in an activity for its inherent values such as advancing one's interest in a topic, while extrinsic motivation refers to external rewards that are separable from the activity itself. In other words, intrinsically motivated learners engage in learning for its own "inherent satisfactions rather than for some separable consequence" (Ryan & Deci, 2000, p.56). In contrast, extrinsically motivated learners are driven by external stimuli, such as high scores and meeting a deadline. Past studies have compared and contrasted differential patterns of learning and engagement between intrinsically and extrinsically motivated learners, affirming the importance of intrinsic motivation to learning (Cerasoli, Nicklin, & Ford, 2014). In the context of ODDE, intrinsic motivation refers to distance learners' interest in enjoyment and valuing of learning tasks and activities offered through ODDE courses. Using a large student sample drawn from different degree programs, Firat, Kılınç, and Yüzer (2018) found that distance learners' levels

of intrinsic motivation were generally high. In terms of the effects of intrinsic motivation, Tang, Xing, and Pei (2018) found that intrinsically motivated learners were more engaged in learning compared to those whose intrinsic motivation was weak. Also, Semenova (2020) found that intrinsically motivated learners were more likely to complete MOOCs and earn a certificate. She attributed these affirmative results to intrinsically motivated learners' positive self-perceptions and their abilities to use strategies successfully to deal with learning challenges. In short, these research examples have provided convergent evidence, verifying the significance of intrinsic motivation to ODL.

Intrinsic motivation may vary with age because, as a learner ages, "the freedom to be intrinsically motivated becomes increasingly curtailed by social demands and roles that require individuals to assume responsibility for nonintrinsically interesting tasks" (Ryan & Deci, 2000, p. 60). This hypothesis of declining intrinsic motivation with age has not yet been tested among distance learners. In addition, the relationship between intrinsic and extrinsic motivation is a contentious topic in the literature. It has been argued that intrinsic motivation can be undermined by external rewards, especially those that are perceived as controlling (Deci, Koestner, & Ryan, 1999). But limited research in ODDE has explored this complex issue. There is, however, some evidence supporting the motivational benefits of extrinsic motivation to ODL. For example, Semenova (2020) showed that an intention to earn a certificate was associated with completion in MOOCs. Further research is required to examine the nature of extrinsic motivation in ODL, taking into account the mediational effect of distance learners' perceptions of external stimuli. In relation to the promotion of intrinsic motivation, recent studies have shown that supportive measures such as responsive tutor feedback (Simons, Leverett, & Beaumont, 2020) and offering of options in assignment (Hanewicz, Platt, & Arendt, 2017) can be effective, suggesting that satisfying distance learners' needs for autonomy and competence may hold the key to promoting intrinsic motivation (Ryan & Deci, 2000).

## Self-Regulation

Self-regulation, according to Zimmerman (1989), offers a management perspective on learning that integrates motivation, emotion, and strategy use for attaining desired outcomes. In the literature, self-regulation is not normally taken as a motivation theory on its own. However, if motivation is about *why* and *how* students are instigated during the learning process, self-regulation offers an important account to the "how" question by examining students' use of cognitive and metacognitive strategies in managing the learning process. Importantly, self-regulated learners are motivated, confident, and strategic. They plan and set goals for their studies, monitor progress, and reflect on learning. They often feel positive about learning and know how to manage negative emotions such as boredom (Cho & Heron, 2015). Expectedly, self-regulated learners usually perform better than their counterparts who are weak in managing the learning process (Bernard, Brauer, Abrami, & Surkes, 2004).

Self-regulation is critical for distance learners, as they are expected to exert a high level of control during the process of learning. Conceptually, self-regulation is a

natural fit aligning with the widely accepted notion of self-directed or self-independent learning in ODDE (Garrison, 2003). Self-regulated strategies including cognitive, metacognitive, and resource management strategies are important self-regulated abilities expected of distance learners who are required to self-direct their learning. Distance learners who effectively deploy these strategies to regulate their learning are engaged during the ODL process; they tend to have better achievement and are more likely to persist (Stephen, Rockinson-Szapkiw, & Dubay, 2020). Significantly, the review of Lee and Choi (2011) found that a lack of self-regulation was a major reason for distance learners who quit online courses, suggesting that promoting self-regulation is an important avenue to tackle the problem of dropout in MOOCs and other ODDE courses (Alario-Hoyos, Estévez-Ayres, Pérez-Sanagustín, Kloos, & Fernández-Panadero, 2017).

Given the benefits of self-regulation, course designs and the provision of support in ODDE need to develop effective practices to promote self-regulation. Andrade and Bunker (2009) depicted a design model for promoting autonomy and self-regulation in distance learning language courses. However, few have built on or adapted their model to promote distance learners' self-regulation. In relation to online learning, Cho and Cho (2017) verified a self-regulation scale to measure interaction online. This represents a new area of research on self-regulation in ODDE, and more research efforts should be expended on this area, given that online interaction has already become a critical component in ODDE. The work of Park and Yun (2018) draws attention to an under-researched area of self-regulation, i.e., regulating motivation, which is important to distance learners because their motivation may fluctuate during the lengthy period of learning. Finally, interview or qualitative studies on self-regulation in ODDE are rarely found, despite the fact that Zimmerman's pioneer work on self-regulation was built on structured interviews (Zimmerman & Martinez-Pons, 1986).

In summary, sociocognitive theories of motivation offer parsimonious models centering around cognitive enablers for understanding motivation and engagement in ODDE. Empirical studies in ODDE, as discussed above, have examined and confirmed the motivational effects on learning and achievement of four cognitive enablers including self-efficacy, achievement goals, intrinsic motivation, and self-regulation. Thus far, motivation research in ODDE has seldom been conducted using motivational models other than those discussed in this section. Future research should broaden theoretical understanding of distance learners' motivated learning and explore additional cognitive enablers using other influential sociocognitive models, such as expectancy-value model and flow theory. In addition, more research effort is certainly required to examine how verified motivational enablers can be used to inform instructional designs to promote distance learners' motivation and engagement.

---

## **Motivating Communities: Empowering Contexts**

In this section, sociocultural theories of learning, inspired by the work of Vygotsky, are used to understand motivation and engagement in ODL. Sociocultural theories situate learners, learning, and motivation within cultural and historical contexts. From a sociocultural perspective, the learner and learning context are reciprocally

related (Nolen et al., 2015); learners are not subjects independent of the context. Learning, motivation, and engagement are embedded in and constituted by a matrix of relationships and interactive processes that are facilitated by advanced peers and cultural tools in a learning context (Renshaw, 1998). This is different from socio-cognitive models that consider learning and motivation as internal processes or individual phenomena. Based on conventional Vygotskian concepts such as zone of proximal development, assisted learning, and cultural tools, Sivan (1986) was the first to argue that a sociocultural perspective enables an examination of contextual and cultural influences on motivation while addressing intra-psychological functioning and inter-psychological influences. Hence, Sivan's theoretical analysis avoids social reductionistic treatment of motivation and broadens our understanding of the social origin of motivation and how it operates beyond an individualistic orientation.

Several major developments in ODDE have made sociocultural theories highly relevant to researching motivation in ODL. First, advanced Internet and computing technologies have enabled asynchronous and synchronous interaction, highlighting ODL as an interactive learning process (Cho & Cho, 2017). This technological turn situates ODL in a technology-enabled social context and challenges the characterization of distance learners as lone learners working through guided materials in a solitary manner. Second, increased learner diversity has become a feature of ODDE. This is especially the case in MOOCs which enroll distance learners from different countries and cultures who hold different purposes and motivations for learning (Alario-Hoyos et al., 2017). Addressing complex issues of motivation arising from learner diversity requires a theoretical framework that is effective in capturing social and cultural influences on motivation and learning. Third, high dropout rates in MOOCs and other ODDE courses accentuate the importance of motivation (Semenova, 2020). A key question is whether ODL environments are engaging to the extent that distance learners' initial motivation is supported and sustained until completion (Ng, 2019). Considering these developments, sociocultural theories of learning, inspired by the work of Vygotsky, are theoretically important for understanding distance learners' motivation and engagement in evolving contexts beyond what an individualistic framework can offer. Context here is not a static entity; neither can it be reduced to distance learners' perceptions, as conceptualized and measured in studies conducted using a sociocognitive perspective.

Different sociocultural theories of learning and development have been proposed in the past several decades, including, but not limited to, communities of practice (Wenger, 1998), situated learning (Lave & Wenger, 1991), guided participation (Rogoff, 1990), activity theory (Engeström, 1987), and distributed cognition (Salomon, 1997). It is impossible to provide a detailed discussion of each of these theoretical frameworks. Below, how motivation can be understood from these sociocultural models is succinctly explained.

Common to these sociocultural models is a Vygotskian principle of social origin of learning and motivation. Differing from sociocognitive models of motivation discussed in the previous section, these sociocultural models maintain that motivation and engagement originate not from internal processes or beliefs but from external realms, as individuals participate in cultural activities, acquire important

cultural tools, collaborate with or are assisted by others, develop a sense of belonging, and build new identities in different communities. Based on Wenger's communities of practice (1998), motivation can be understood as part of a joint enterprise in a community where newcomers acquire shared knowledge and practices through interacting with core members and participating in valued activities. From the perspective of activity theory (Engeström, 1987), motivation is situated in a specific activity system wherein a team of subjects or individuals' tool-mediated actions and interactions toward a shared object and outcome are constrained by a distinct set of norms, rules, and roles shared among members of relevant communities. Rogoff's work on guided participation (1990) highlights motivation derived from collaboration with and guidance offered by carers or advanced peers who help apprentices acquire culturally valued knowledge and skills and understand not only how to use them but also why they are important in complex social settings. Offering a similar focus on collaboration, the work of Salomon (1997) on distributed cognition highlights that cognition is not confined to our head but also located in the social and material worlds wherein collaboration is an important way for improving cognitive performance. Ng (2019) built on this work and proposed the notion of distributed motivation, pointing out that motivation is not confined to individuals' cognitive attributes but also present in different aspects of an ODL activity system. To sum up, based on these sociocultural theories, motivation is social, contextual/situated, mediated, interactive, and evolving. Further discussions on a sociocultural perspective on motivation can be found in recent motivational analyses that have built purposefully on these sociocultural theories (e.g., Nolen et al., 2015).

Researching motivation from a sociocultural perspective is to examine how motivation is socially constructed, emerges through social interaction, and manifests in participation and engagement in a social setting. In short, motivation is context-embedded and cannot be fully understood if it is removed from the context. This also means that the research unit is no longer confined to individuals or their perceptions or cognitions but should involve the person and the context, i.e., a community together with its members. To illustrate, Nolen (2007) provided longitudinal data to show how grade 4 students' motivation to read and write was influenced by social meanings of literacy activities that were co-constructed among collaborating students and teachers in classroom communities. These students' motivation to read and write could not be accurately understood if social influences derived from the classroom communities were not considered.

When it comes to ODL, a sociocultural perspective on motivation draws attention away from distance learners or whether they are motivated. Analytic primacy should focus predominantly on the provision of motivational support through careful instructional designs and delivery of engaging materials and collaborative opportunities. This is empowering, as it shifts the research focus from motivated learners to motivating learning environments (Ng, 2019) and avoids a deficit perspective that places the blame mainly on distance learners when they fall behind or quit prematurely. Though sociocultural studies on motivation in ODL, compared to sociocognitive investigations, remain scarce (Ng, 2019), impactful studies were reported elaborating how community-of-practice designs promote participation (e.g., Cowan & Menchaca,

2014) and how collaboration and peer supports mediate learning and engagement (e.g., Engle, Mankoff, & Carbrej, 2015). As a case in point, Nye (2015) described the development of an online academic community for an arts degree program where lecturers, students, and alumni participated as members. Specific activities and sharings, such as lecturers' and alumni's sharings of their learning experiences, were designed to promote interaction and facilitate students' aspiration for postgraduate research studies. Off-campus students acknowledged that participating in this online portal promoted a sense of belongingness and connection.

However, current sociocultural studies on motivation in ODDE, as illustrated in the examples cited above, share a common weakness in that motivation is not explicitly addressed, monitored, or measured. In this case, arguments concerning how sociocultural designs in ODL promote motivation and improve engagement remain inconclusive. In addition, it should be noted that many ODL studies (e.g., Fung, 2004) that have investigated topics such as interaction and collaboration are not always designed using or aligning with sociocultural theories or models. Therefore, more concerted efforts are required to examine motivation from a sociocultural perspective given the issues of dropout, increased diversity, and the critical importance of deploying technologies as a cultural tool for learning. Following Vygotsky, a sociocultural perspective on motivation and engagement in ODDE should focus on the social nature of motivation and to understand how motivation is initiated, developed, and changed, as distance learners participate and co-participate in different ODL contexts that are socially, culturally, and technologically constructed (cf. Nolen et al., 2015; Walker, 2010). This requires an orchestration of a suite of research methodologies including interview and observation to capture contextual particularities and influences. Research attention should also be given to developing and examining effective sociocultural designs utilizing advanced technologies as a cultural tool to promote motivation, participation, and engagement in ODDE.

---

## **Experiencing Motivation-as-Lived: Empowering Experiences**

In the previous two sections, motivation is discussed as personal attributes from a sociocognitive perspective and as socially originated and contextually embedded constructs based on sociocultural theories. Extending the sociocultural discussion of motivation, an important theoretical issue is how the social becomes individual, and vice versa. Addressing this issue, Walker (2010) discussed the relationship between the social and individual. Based on Valsiner's notion of inclusive separation (1997), Walker argues that the social and individual are dynamically interdependent. This theoretical argument is important for understanding and researching motivation, as it points to the fact that motivation is not socially determined and should be understood as dialectical relations between the social and individual, which is also an important issue that Vygotsky discussed toward the end of his life using the concept of *perezhivanie* (i.e., emotional lived experience; Vygotsky, 1994). In this section, the Vygotskian concept of *perezhivanie* is invoked to explore motivation as an ongoing experiential process whereby motivation is derived from distance learners' lived

experiences of ODL and how they make sense of them. This situates motivation in dialectical relations between the person and context (cf. Ng, 2021).

In “The Problem of Environment,” Vygotsky (1994) recounted three children’s distinct *perezhivaniya* (plural) in an abusive home environment where each child felt uniquely about this shared problem/context and responded differently due to differences in social roles and cognitive understanding. Vygotsky (1994) used this case to illustrate the generative function of the concept of *perezhivanie* for understanding child development, stating:

the emotional experience (*perezhivanie*) arising from any situation or from any aspect of his [sic] environment determines what kind of influence this situation or this environment will have on the child. Therefore, it is not any of the factors in themselves (if taken without reference to the child) which determines how they will influence the future course of his development, but the same factors refracted through the prism of the child’s emotional experience (*perezhivanie*). (p. 339)

The refractive process, mentioned in the quote above, highlights the importance of locating significant factors and conditions derived from both internal and external sources that one uses to make sense of an event or experience. Hence, *perezhivanie* represents how an individual “becomes aware of, interprets, [and] emotionally relates to a certain event” (Vygotsky, 1994, p. 341).

*Perezhivanie* is understood generally as an emotional lived experience in western scholarship (Blunden, 2016). It was Vygotsky’s attempt to define a unit of analysis that avoids divisions between person and environment, between thinking and feeling, and between consciousness and action (González Rey, 2011; Roth, 2017; Veresov & Flear, 2016). *Perezhivanie* can be understood as a phenomenon and as a theoretical concept (Veresov & Flear, 2016). As a phenomenon, *perezhivaniya* are anchored to actual emotionally charged episodes or dramatic events that are lived through and relived (Blunden, 2016). As a concept, *perezhivanie* involves dialectical relationships between the person and context (Veresov & Flear, 2016), complex connections between emotion and cognition (Roth, 2017), and a refractive process whereby individuals construct a subjective configuration uniting the internal and external realms (González Rey, 2011). Aligned with a *perezhivanie* perspective, motivation is derived from distance learners’ learning experiences and their refraction of these experiences across time and space. Motivation and engagement can therefore be recast as in-the-moment experience and beyond-the-moment reflection, hence experiential and reflective in nature (see Ng, 2021; Ng & Renshaw, 2019 for research examples elaborating these ideas). This conceptualization offers a way of theorizing motivation and motivated engagement as an ongoing process that is simultaneously sense-making, self-making, and laden with affect (Renshaw & Tooth, 2016). It addresses the conceptual limitation of separating the personal and social realms into independent entities. It also highlights the historical process of motivation and engagement, as learners bring their life experiences to every socially and culturally constructed context they participate as a member (Ng & Renshaw, 2019). Furthermore, *perezhivanie* acknowledges the critical role of emotions during the motivational process (Roth, 2017).

Research on *perezhivanie*, though limited, has begun to attract interest among educational researchers working in different areas. In the field of early childhood education, Chen (2022) showed how parents' own *perezhivaniya* play a significant role in supporting children's emotional regulation. In the field of teacher education, Golombek and Doran (2014) highlighted the pervasiveness of emotional content and its link with novice teachers' *perezhivaniya* of teaching. In relation to learning and engagement, Ng and Renshaw (2019) used this concept to track the evolvement of and changes in reader identities of an Indigenous Australian student, Lisa, over 3 years. In this study, motivation to read was shaped constantly by Lisa's experiences of reading in school and at home, her feelings and interpretations of these experiences, and the identities that she created or was assigned to her, as she read for different purposes to meet personal needs and others' expectations in different settings. In another study (Ng, 2021), two middle school students' learning intentions and subject choice plans in mathematics were tracked for 3 years. The findings showed that subject choice is not just a decision that is made at a specific point of time but also involves an extended socially constructed process that is interspersed with contradictions, uncertainties, and struggles. Complex connections between emotions and cognitions were involved, as these students engaged in mathematics activities and considered their future in this subject area.

These empirical examples, alongside the theoretical works of Blunden (2016), González Rey (2011), Roth (2017), and Veresov and Fleer (2016), have significant implications for researching motivation in ODDE. First, distance learners' motivation can be understood as experiential in nature. Motivation is derived from distance learners' in-the-moment experiences as they engage in different components of ODL, alone or in collaboration with others in online or offline settings. Motivation can be derived from distance learners' own psychological realm, as well as technological, material, and other external realms in each learning occasion or event. From a *perezhivanie* perspective, the key is to consider these different elements as a united whole for understanding distance learners' personal learning experiences and their experiential motivation in a specific situation. Importantly, different interpretations and meanings can be imbued from a shared experience by different learners, which may be associated with differential motivation responses. Also, a distance learner may feel differently about a past experience or a similar event and hence be motivated differently, as relevant circumstances and considerations may change over time. Second, distance learners' motivation involves complex connections between emotion, cognition, and action, which, at times, can be inconsistent. For example, a distance learner may persist even though limited motivation can be derived from distance learning materials that are perceived as disengaging. Understanding this learner's *perezhivanie* provides an important insight on how conflicting emotions and cognitions are interpreted and resolved to inform his or her motivated action to persist. Third, distance learners' experiential motivation involves a refractive process. To understand distance learners' refraction means to understand how they make sense of their learning experiences in ODL, i.e., learners' subjective understanding of a learning experience. In this context, as Vygotsky argues (1994), it is important to locate the factors and conditions derived from distance learners'

personal and social contexts that influence how they interpret their experiences or how these experiences become personally significant or meaningful, hence representing a source of motivation. Locating these constitutional factors in personal and social realms and examining complex interplays between them in relation to a specific learning situation are critical for understanding distance learners' motivation and its origin, changes, and consolidation. In short, from a perezhivanie perspective, distance learners' motivation is not confined solely to personal attributes; neither can it be fully understood by examining exclusively a learning situation or context. Simultaneous assessment of both personal and social realms and their complex transactions distinguishes a perezhivanie perspective for researching motivation from other sociocultural models, such as those discussed in the previous section.

Elaborating the relationship between perezhivanie and identity, Blunden (2016) writes:

if you were to write a biography of a person, wouldn't you have to connect together the perezhivaniya of their life and demonstrate to the reader who the person was and how they came to be that person – the experiences they had and how they overcame them? And as a writer, you would be unlikely to view the series of life-crises, the experiencing and overcoming of which made the person who they were, to be simply events that happened to the person. (pp. 277–278)

Replacing “a person” in the quote above with “a distance learner” will reveal clearly why perezhivaniya are important for understanding motivation and engagement during the lengthy process of ODL. Inherently, the motivational process in ODL is changeable; distance learners may feel motivated at one time but less so at another time. The concept of perezhivanie facilitates a better understanding of distance learners' evolving motivation (including inconsistencies in motivation) in their lived experiences of learning and refraction across different times and spaces of ODDE. Research attention is required to examine the phenomenon of perezhivanie in ODL with a focus on distance learners' emotionally charged experiences and dramatic events during the protracted journey of distance learning. Crafting such empirical base is critical for unleashing the pedagogical potentials of the generative concept of perezhivanie that Vygotsky turned to shortly before his untimely and premature death that ended his impactful academic life.

---

## Conclusion

ODDE empowers distance learners. A widely accepted aim for ODDE is to offer an alternative pathway or a second chance education for learners who have somehow missed the opportunity in mainstream education. In addition, many ODDE courses, mostly in the higher education sector, aim to provide flexible learning options addressing students' needs and accommodating student diversity. In advancing both aims, how ODL motivates distance learners is critical. If ODL fails to motivate and engage distance learners, it inevitably falls short of its ideal in providing a

second chance education empowering the disadvantaged or offering a flexible option addressing learners' needs.

This chapter discusses motivation theories that conceptualize motivation as individualistic (sociocognitive), contextual (sociocultural), and experiential (perezhivanie), underscoring the importance of several key questions about motivation in ODDE: are distance learners motivated? Are distance learning environments motivating? How do distance learners make sense of their ODL experiences? Each of these theoretical perspectives offers a unique way for researching and promoting motivation, highlighting empowering personal attributes, and motivating contexts and personally meaningful experiences, respectively. Put specifically, sociocognitive theories focus on cognitive enablers that motivated distance learners hold and use to propel their learning. These cognitive enablers provide parsimonious models for understanding distance learners' motivation and for informing the development of engaging instructional designs. Nevertheless, the image of a lone learner working through self-guided correspondence materials is no longer a valid characterization of distance learners in ODDE. ODL has become complex due to advanced technologies that enable asynchronous and synchronous interaction, large enrolments, and increased student diversity. Sociocultural theories of motivation enable a better understanding of motivation that is situated and evolving in these complex contexts of ODDE. Importantly, sociocultural theories have the potential to unravel the enablement of a motivating learning context, highlighting the critical role of motivational support. Finally, a perezhivanie perspective pinpoints the importance of examining how ODL is being experienced and what personal meanings are imbued from different ODL experiences during the protracted journey of learning. This new perspective holds the potential to improve our understanding of distance learners' evolving motivation during the extended process of ODL. In short, the key theoretical perspectives discussed in this chapter, i.e., sociocognitive, sociocultural, and perezhivanie perspectives of motivation, are equally important for ODL and for advancing the goal of empowering distance learners through ODDE.

## Abstract

The chapter provides a comprehensive and up-to-date insight into main research findings in the area of educational technology acceptance, adoption, and usage. Over the past decades, a variety of theoretical perspectives have been advanced to provide an understanding of the determinants of adoption of various technologies used to support the process of knowledge transfer and acquisition. Although some prominent theoretical approaches in educational contexts include Innovation Diffusion Theory (IDT), Unified Theory of Acceptance and Use of Technology (UTAUT), as well as Motivational Model (MM), research reveals the Technology Acceptance Model (TAM) as the most influential model and leading scientific paradigm in investigating acceptance of educational technology by students, teachers, and other stakeholders. Aiming to increase their predictive validity, in numerous empirical studies, models have been extended with different predictive factors, like the most often validated self-efficacy, subjective norm, perceived enjoyment, perceived playfulness, anxiety, social influence, system quality, and facilitating conditions. Research revealed electronic learning (e-learning) as the

most common validated mode of delivery, followed by mobile learning (m-learning), learning management system (LMS), personal learning environment (PLE), and massive open online course (MOOC), along with different supportive facilitating technologies used in education such as social media platforms, teaching assistant robots, simulators, as well as virtual reality (VR) and augmented reality (AR) technologies. To enhance explanatory power, new developments in educational technology acceptance and adoption have suggested the need of integration of TAM and UTAUT with other contributing adoption and post-adoption theories and models, together with several established approaches from other fields.

**Introduction**

More than a half-century of research has resulted in the development of a vast number of adoption theories and technology acceptance models, along with a plethora of their extensions and modifications. To test their applicability and enhance their predictive validity, established theories and models have been widely used to facilitate assessment of diverse information and communication technology (ICT) products and services, including all kinds of technologies, systems, environments, tools, applications, services, and devices. In general, technology adoption is a term that refers to the acceptance, integration, and embracement of new technology. Technology acceptance, as the first step of technology adoption, is an attitude toward technology, and it is influenced by various factors. According to the Innovation Diffusion Theory (IDT) (Rogers, 1962, 1995), adoption is a decision to make full use of technology innovation as the best course of action available. The key to adoption is that the adopter (individual or organization) must perceive the idea, behavior, or product as new or innovative. As for technology adoption research at the individual level, numerous theories and models have been used to predict and explain human behavior toward adoption of various technologies.

An area of great interest in incorporating new technologies is the educational field. Educational settings involve a great variety of potential users of various ICT technologies embraced in the process of learning, teaching, and assessment. Thus, technology acceptance and adoption theories and models are often used to inform research in the context of education. Some of the most influential theoretical approaches involve (listed in chronological order) IDT (Rogers, 1962, 1995), Theory of Planned Behavior (TPB) (Ajzen, 1985, 1991), Decomposed Theory of Planned Behavior (DTPB) (Taylor & Todd, 1995), Technology Acceptance Model (TAM) (Davis, 1986, 1989), Motivational Model (MM) (Davis, Bagozzi, & Warshaw, 1992), and Unified Theory of Acceptance and Use of Technology

(UTAUT) (Venkatesh, Morris, Davis, & Davis, 2003), along with extended UTAUT (UTAUT2) (Venkatesh, Thong, & Xu, 2012).

This chapter offers a comprehensive and up-to-date insight into main research findings in the area of educational technology acceptance and adoption. The chapter is divided into four sections. The second section provides a brief overview of basic concepts of major theories and models used in the educational field, along with some sample contributions. Most important research themes and findings, together with new developments in educational technology acceptance research, are introduced in the third section. The last section offers concluding remarks and further research directions.

---

## Technology Acceptance Theories and Models in Educational Contexts

Over the past decades, a diversity of theoretical perspectives has been put forward to provide an understanding of the determinants of usage and adoption of different technologies to support the process of learning, teaching, and assessment. For example, IDT, proposed by Rogers (1962, 1995), is the oldest and very popular theory of adoption of innovations among individuals and organizations. In this context, “innovation” can be anything that is perceived as new from the perspective of the adopters and may be described by five characteristics: *relative advantage*, *compatibility*, *complexity*, *traceability*, and *observability*. IDT was used, for example, to identify the factors influencing the use of Moodle as a learning management systems (LMS) in the academic context (Pinho, Franco, & Mendes, 2021) and to investigate potential factors influencing students’ behavioral intentions to use e-learning systems (Al-Rahmi et al., 2019).

Davis et al. (1992) applied the motivational theory to study information technology adoption and use. MM, based on the psychological aspects of technology acceptance, hypothesizes that the individual’s behavior and her/his technology acceptance and usage are influenced by intrinsic and extrinsic motivation. An example of intrinsic motivation is *perceived enjoyment*, while *perceived usefulness*, *perceived ease of use*, and *subjective norm* can be considered as examples of extrinsic motivation. Accordingly, MM was employed to explore intrinsic (*effort expectancy*, *anxiety*, and *attitude toward e-learning*) and extrinsic (*performance expectancy*, *social influence*, and *facilitating conditions*) motivators aiming to explain why employees might accept the e-learning technology in the workplace (Yoo, Han, & Huang, 2012).

DTPB, introduced by Taylor and Todd (1995), suggests that the three predictors of the behavior intention and actual behavior adoption are *attitude*, *subjective norms*, and *perceived behavior control*. This model promotes decomposed belief structures since attitudinal, normative, as well as control beliefs are additionally decomposed into multidimensional belief constructs. DTPB was used, for example, to examine factors that impact the acceptance and usage of e-assessment by academics, specifically attitude (*perceived ease to use*, *perceived usefulness*, and *compatibility*),

subjective norm (*peer influence* and *superior influence*), as well as perceived behavioral control factors (*self-efficacy*, *resource-facilitating conditions*, and *information technology support*) (Alruwais, Wills, & Wald, 2017).

Basic concepts of two major technology acceptance models and theories used in educational contexts, namely, UTAUT and TAM, are introduced in this section. To illustrate their broad potential and applicability, some relevant sample research is presented as well.

## Technology Acceptance Model (TAM)

### Theory of Reasoned Action (TRA)

Originating in the psychology-based Theory of Reasoned Action (TRA), TAM proposed by Davis (1986, 1989) has evolved to become the key model in understanding predictors of human behavior toward potential acceptance or rejection of technology in general and learning technology in particular. Assuming that individuals are usually rational, Fishbein and Ajzen (1975) developed TRA to predict and understand behaviors and attitudes. TRA suggests that a main predictor of *behavior* is an individual's behavioral intention, while an individual's intention is jointly determined by her/his attitude toward performing the behavior (attitude), as well as perceived social influence of people who are important to the individual (subjective norms). *Behavioral intention* has typically been defined as an individual's subjective probability that he/she will perform a specified behavior and *attitude* as an individual's degree of evaluative affect toward the target behavior, while *subjective norm* refers to the person's perception that most people who are important to him/her think he/she should or should not perform the behavior in question (Davis, 1986).

### Emergence of TAM

To develop a reliable model which could predict actual use of any technology, Davis adapted TRA since he considered attitudes, rather than behavioral intentions, as the main predictors of behavior. Davis suggested that the user's motivation can be explained by three factors, in particular *perceived ease of use*, *perceived usefulness*, and *attitude toward using*. Thus, TAM specifies two beliefs, perceived usefulness and perceived ease of use, as determinants of attitude toward usage intentions and actual technology usage.

In his doctoral dissertation version of TAM, Davis (1986) hypothesizes that the attitude of a user toward the system (*attitude toward using*) is a major determinant of whether the user will use or reject the system (*actual system use*). The attitude of the user, in turn, is considered to be influenced by two major beliefs, perceived usefulness and perceived ease of use, with the perceived ease of use having a direct influence on the perceived usefulness. *Perceived usefulness* is defined as the degree to which the person believes that using the particular system would enhance her/his job performance, while the *perceived ease of use* is defined as the degree to which the person believes that using the particular system will be free of effort (Davis,

1986). Finally, both beliefs are hypothesized to be directly influenced by the *system design characteristics*.

### **Modifications and Extensions of TAM**

During later stages, TAM was modified and extended to include new factors with significant influence on its two core variables. The strength of TAM and its many different versions that extend/modify the original model by simply adding other constructs (called “TAM++,” cf. Benbasat & Barki, 2007) is confirmed by numerous studies emphasizing its broad applicability to various technologies, users, and contexts.

TAM’s core variables, perceived ease of use and perceived usefulness, have been proven many times to be sound predictive factors that have affected acceptance of learning with technology as well. The intentions of a user toward using learning technology in a vast majority of research were explained by using or extending the TAM research model with numerous relevant constructs (predictive factors). While, for example, Farahat (2012), along with Chipps, Kerr, Brysiewicz, and Walters (2015), has tested application of the original (core) TAM in educational areas, Yu (2020) extended TAM with *perceived enjoyment* and two psychological constructs, *conformity behavior* and *self-esteem*, in order to test the acceptance of WeChat use in language learning, Lin and Yeh (2019) added *perceived playfulness* as an intrinsic motivator to explore the acceptance of virtual reality (VR) motion control technology for mental rotation learning, while Aburagaga, Agoyi, and Elgedawy (2020) used the extended TAM model to assess the faculty needs for adopting social networks into educational settings (used constructs: *privacy*, *infrastructure*, *institutional support*, and *access devices*).

### **Prevalence of TAM in Educational Technology Adoption**

Overall, research has revealed that TAM is the most widely used powerful and valid model for prediction and explanation of user’s behavior toward acceptance and adoption of educational technology (Abdullah & Ward, 2016; Granić & Marangunić, 2019). Empirical evidence for the predictive validity of TAM has been provided in numerous educational technology acceptance studies, with the most recent research addressing *electronic learning* (Prasetyo et al., 2021), *mobile learning* (Lai, 2020), *personal learning environments* (PLEs) (Rejón-Guardia, Polo-Peña, & Maraver-Tarifa, 2020), *virtual reality environments* (VLEs) (Fussell & Truong, 2021), *massive open online courses* (MOOCs) (Al-Adwan, 2020), and *learning management systems* (LMSs) in general (Dampson, 2021), as well as, for example, open-source LMS Moodle (Vanduhe, Nat, & Hasan, 2020) and commercial LMS Blackboard (Ibrahim et al., 2017) in particular.

Furthermore, various acceptance studies have explored TAM’s applicability for different supportive facilitating technologies used in education, ranging from *social media platforms* (Al-Rahmi et al., 2021; Yu, 2020) to the technology aimed at helping the learning process through *teaching assistant robots* (Park & Kwon, 2016), *simulators* (Lemay, Morin, Bazelais, & Doleck, 2018), *virtual reality* (Lin & Yeh, 2019), and *augmented reality technologies* (Jang, Ko, Shin, & Han, 2021), among very many others.

## Unified Theory of Acceptance and Use of Technology (UTAUT)

### Emergence of UTAUT

Venkatesh et al. (2003) revised existing theories and models on acceptances of new technologies and proposed UTAUT by reviewing and integrating eight previously established user acceptance models, i.e., Theory of Reasoned Action (TRA) (Fishbein & Ajzen, 1975), TAM, MM, TPB, augmented TAM (A-TAM) (Davis, 1986, 1989; Davis, Bagozzi & Warshaw, 1989), Model of Personal Computer Utilization (MPCU) (Thompson, Higgins & Howell, 1991), IDT, and Social Cognitive Theory (SCT) (Bandura, 1986). Three main constructs that directly determine behavioral intention are proposed, namely, *performance expectancy*, *effort expectancy*, and *social influences*. Besides, *behavioral intention* and *facilitating conditions* are foreseen as predictors of actual behavior (usage). Accordingly, the core UTAUT (i.e., the four principal determinants of intention and usage) was used, for example, to explore the factors that influence preservice teachers' acceptance of ICT integration in the classroom (Birch & Irvine, 2009), as well as to evaluate students' e-learning acceptance in a postgraduate program (Mahande & Malago, 2019), and students' usage of e-learning systems in developing countries (Abbad, 2021).

Usually, the original model is extended by simply adding additional constructs. For instance, to examine core factors affecting the university students' attitude toward adoption of online classes during COVID-19 (Tiwari, 2020), the UTAUT model was modified with single construct *perceived cost*. Yet, a majority of studies extended the core model with multiple constructs. For example, in the investigation of university students' behavioral intentions toward using m-learning in higher education, UTAUT was extended by incorporating the constructs of *mobile self-efficacy*, *perceived enjoyment*, *satisfaction*, and *trust* (Chao, 2019). In another study, the UTAUT model was applied to examine the effects of different factors that were identified from the literature on students' acceptance of mobile learning applications in higher education, in particular *perceived information quality*, *perceived compatibility*, *perceived trust*, *perceived awareness*, *availability of resources*, *self-efficacy*, and *perceived security* (Almaiah, Alamri, & Al-Rahmi, 2019).

### UTAUT2 as an Extension of UTAUT

Paying particular attention to the consumer use context, Venkatesh et al. (2012) extended the original UTAUT and developed UTAUT2. To formulate UTAUT2, they added three new constructs that directly determine behavioral intention, in particular *hedonic motivation*, *price value*, and *habit*. Also, besides behavioral intention and facilitating conditions, the model also postulated habit as an additional predictor of usage. Extended UTAUT (UTAUT2) was used, for instance, to evaluate acceptance of blended learning in executive student education (Dakduk, Santalla-Banderali, & van der Woude, 2018), as well as to explore preservice teachers' acceptance of learning management software (Raman & Don, 2013). However, the construct price value is excluded in both studies since it has been used only to study consumer behavior in other technological conditions like e-commerce, e-banking, or online payment.

As already mentioned, TAM and UTAUT are the two most prominent theoretical approaches in educational contexts. Comparison of the two models is out of the scope of this chapter, but as concluding remarks of this section, few aspects should be noted. On the one hand, for practical, predictive applications of the model, fewest possible but still effective numbers of constructs/factors could be of great importance (called model's parsimony). Evidently, TAM's parsimony has been proven to be valid and powerful approach to explain technology acceptance. On the other hand, to obtain the most complete understanding of the validated technology, the level of parsimony may be sacrificed (Samaradiwakara & Gunawardena, 2014). It has been shown that UTAUT is rich in explaining behavioral intention and usage of technology. However, despite its good explanatory ability, it has been criticized for having too many independent constructs for predicting intentions and behavior (Bagozzi, 2007).

---

## **Major Findings in Educational Technology Acceptance Research**

Educational settings involve a wide range of potential users of ICT products and services used to support the process of knowledge transfer and acquisition; thus, technology adoption investigation is often used to inform educational research. Major research themes and findings, along with recent developments in the field of educational technology acceptance and adoption, are given in the following.

### **Major Research Themes and Findings**

#### **Educational Technologies Validated and Users Involved**

When it comes to the use of variety of technologies, it can be noted that the majority of acceptance studies in educational areas validated e-learning modes of delivery, referred to as e-learning systems, e-learning platforms, e-learning environments, and e-learning tools or just denoted as e-learning. Many studies also addressed mobile learning in which context mobile computing devices, mobile technology and applications, tablet personal computers, or just m-learning was considered.

Learning management systems (LMSs) in general, along with specific LMSs in particular, such as Blackboard and Moodle were also frequently researched. Besides, various studies in educational contexts counted on support of social media services and platforms at large, for example, WeChat and YouTube in particular. Educational affordances of virtual reality (VR) and augmented reality (AR) are attracting increasing attention; thus, several studies focus on VR, AR, and mixed reality technologies. Examination of technology acceptance work in the educational domain also includes validation of technology for collaborative learning, simulation-based learning environments, massive open online courses (MOOCs), as well as open educational resources (OER).

Regarding the type of users, in a great majority of research, university students were the most commonly chosen sample group (Abdullah & Ward, 2016; Granić &

Marangunić, 2019). Various studies also involved employees from different types of organizations and companies, university teaching staff, as well as teachers from preservice, in-service, and special education.

### **Most Researched Predictors of Technology Acceptance**

The research in educational technology acceptance and adoption has revealed that the great majority of acceptance studies use TAM (cf. Al-Emran & Granić, 2021; Granić & Marangunić, 2019), but an employment of UTAUT model is also well accepted, albeit in a considerably smaller number of studies. Besides, aiming to increase the predictive validity of TAM and UTAUT, the models have usually been extended with different predictive factors. When using UTAUT model, those factors are related to behavioral intention, while when using TAM the majority of factors represent predictors of the two core variables, *perceived ease of use* and *perceived usefulness*, with a small number predicting behavioral intention.

Numerous empirical studies conducted in educational contexts have revealed that *self-efficacy*, i.e., an individual judgment of one's capability to use a specific technology, has a significant impact on the perceived usefulness and perceived ease of use. In addition, as one of the most commonly used predictors, self-efficacy was found to have a direct effect and a positive influence on behavioral intention to use e-learning, m-learning, and computers in educational settings in general.

Other widely researched predictive factors are *subjective norm*, defined as the degree to which an individual believes that people who are important to her/him think she/he should perform the behavior in question, as well as *perceived enjoyment* referring to the extent to which the activity of using a technology is perceived to be enjoyable in its own right. It has been revealed that subjective norm and enjoyment positively influence students' perceived usefulness and perceived ease of use of e-learning systems. Besides, *subjective norm*, as an important construct in providing an understanding of the determinants of usage in educational contexts, is shown to have a strong influence on the behavioral intention to use e-learning systems and platforms. Another predictor dealing with societal aspects which significantly affects learning technology adoption (m-learning) is *social influence*, the degree to which an individual perceives that others believe that he or she should use the new system.

Furthermore, *perceived playfulness* is found to be one of the key drivers for the adoption and use of blended learning as well as computer-assisted training programs. While perceived playfulness, which questions how intrinsic motivation affects an individual's acceptance of technology, has a direct impact on the variables of perceived usefulness and perceived ease of use, *anxiety* as a personal trait explained as evoking anxious or emotional reactions when it comes to performing a behavior negatively affects the two core TAM variables.

*System quality* and *system accessibility*, along with *facilitating conditions* which originally provide resource factors (such as time and money needed) and technology factors regarding compatibility issues that may constrain usage, are found to be essential factors that affect technology acceptance as well.

## New Developments in Educational Technology Adoption

TAM and UTAUT have attracted significant attention in educational technology adoption research. To cover all significant components in determining technology adoption in educational settings, these models have been widely extended, as mentioned earlier, with other factors which have improved their overall predictability power. Furthermore, although both models proved to be applicable to various technologies and educational contexts at individual level, research has also revealed their successful integration with other relevant approaches from other fields.

### Integration of TAM

Although TAM has proved to be a powerful model applicable to a variety of technologies and contexts at the individual level, research also reveals its successful integration with other contributing theories and models within a range of different application fields (Al-Emran & Granić, 2021). To advance the model's explanatory power in the educational research, TAM has been integrated with other technology adoption (e.g., IDT and TPB) and post-adoption (e.g., Information Systems Success Model (ISSM) and ECT) theories and models, as well as with a number of additional approaches, for example, Task-Technology Fit (TTF), Protection Motivation Theory (PMT), and System Usability Scale (SUS), among many others. The integration of TAM with the aforementioned approaches together with related sample research is presented below.

IDT, as the most popular model in investigating innovation acceptance and adoption, was integrated with TAM to empirically explore university students' intention to use e-learning systems (Al-Rahmi et al., 2019), investigate factors affecting business employees' behavioral intentions to use the e-learning system (Lee, Hsieh, & Hsu, 2011), as well as explore diffusion and adoption of an open-source learning platform (Huang, Wang, Yang, & Shiau, 2020).

TPB (Ajzen, 1985, 1991), an extension of TRA which asserts that behavior is a direct function of behavioral intention and perceived behavioral control, was used with TAM to explain how perceptions influence m-learning adoption among university students (Gómez-Ramirez, Valencia-Arias, & Duque, 2019).

ISSM, introduced by DeLone and McLean (1992) as a robust theoretical basis for the study of technology post-adoption, was combined with TAM in a couple of recent studies, in particular to help determine factors which affected acceptance of e-learning platforms during the COVID-19 pandemic (Prasetyo et al., 2021) and in exploring students' behavioral intention to use social media, specifically the perception of their academic performance and satisfaction (Al-Rahmi et al., 2021).

ECT, a post-adoption theory offered by Oliver (1980), was integrated with two other theories, TAM and ISSM, to understand and identify several attributes as likely predictors of e-learning continuance intention (Roca, Chiu, & Martinez, 2006).

TTF, a theoretical model proposed by Goodhue and Thompson (1995) which asserts that for information technology to have a positive impact on individual performance the technology must be utilized and must be a good fit with the tasks it supports, was used with TAM to explore the students' behavioral intention to adopt

smartwatches for learning activities (Al-Emran, 2021), as well as to explore continuance intention to use massive open online courses (MOOCs) (Wu & Chen, 2017).

PMT, a theory postulated by Rogers (1975) and considered as a special case of a more general category of theories that employ “expectancy” and “value” constructs, was integrated with TAM to study students’ behavioral intention to adopt smartwatch devices in learning activities (Al-Emran, Granić, Al-Sharafi, Nisreen, & Sarrab, 2021).

SUS, a reliable and low-cost attitude scale from the field of human-computer interaction (HCI) developed by Brooke (1986) and used for subjective assessments of technology usability (i.e., its ease of use in a particular context), was combined with TAM to evaluate perceived usability of the online learning platforms during COVID-19 (Pal & Vanijja, 2020).

### Integration of UTAUT

UTAUT integration/enhancement with further models is mostly related to users’ continuance intention of using mobile banking and payment, or to employees’ adoption of e-government, but seldom used in education. In such a context, usually representative post-adoption theories and models have been considered. Some contributing theories along with relevant sample research are offered in the following:

*Technology Acceptance Model (TAM)*, an extensively used powerful model in technology acceptance and adoption research in general, was integrated with UTAUT to explore and explain predictive factors that influence preservice teachers’ intention to use learning management system (LMS) in developing countries (Buabeng-Andoh & Baah, 2020).

*Expectation-Confirmation Theory (ECT)* (Oliver, 1980), a leading cognitive theory in the area of consumer satisfaction which seeks to explain post-purchase or post-adoption satisfaction as a function of expectations, perceived performance, and disconfirmation of beliefs, was used in a most recent study which extended UTAUT with the aim of exploring students’ perspectives regarding the acceptance of mobile learning in higher education (Alowayr & Al-Azawei, 2021).

---

## Conclusion and Further Research Directions

Due to continuous development of new technologies, there is still a huge potential for further advancement, exploration, and practice in the field of educational technology adoption, despite the fact that extensive work has already been conducted. In light of current research findings, future work could follow new research directions listed below:

To explore predictive validity of technology acceptance models and theories when applied to various supporting ICT technologies employed in:

- Emerging teaching strategies, for example, *flipped learning*, an active teaching-learning approach which has proved to motivate students to engage in out-of-

classroom activities, as well as *gamification-based learning*, another approach to facilitating students' participation and proactive behaviors

- Encouraging communication support, for example, the broadly used online *discussion forums* and *discussion boards*, which extend the learning space beyond the classroom and provide asynchronous opportunities for peer-to-peer collaborations

To empirically validate predictive factors, i.e., determinants, influencing the acceptance and adoption of technology in education which have not been widely explored, for example, psychological influence factors such as:

- *Flow*, perceived as an intrinsic motivation and a holistic experience of an individual when involved in the action
- *Conformity behavior*, seen as the behavior that individuals tend to follow others or the phenomenon that their behaviors are greatly influenced by others
- *Self-esteem*, understood as a sort of attitude toward an individual's general subjective emotional assessment of her/his own value

To advance the explanatory power of individual technology acceptance and adoption models by considering contributions from established theories and models from other fields, for example:

- Social psychology – Bagozzi and Warshaw's (1990) *Theory of Trying* (ToFT): Since intentions do not always lead to a specific action, the criterion of behavior in TRA is replaced with trying to reach a goal.
- Positive psychology – Seligman's (2011) *PERMA Theory*: As positive psychology is about the concept of well-being, the theory postulates five relevant elements: positive emotion, engagement, relationships, meaning, and accomplishment (PERMA).
- Information technology – Thompson et al.'s (1991) *MPCU*: Due to intensive spread of information technologies, Triandis' (1977) *Theory of Interpersonal Behavior* (TIB) is adapted and refined for ICT contexts and used to forecast individual acceptance and personal computer (PC) utilization.

**Abstract**

This chapter sets out to explore the research field of open, distance, and digital education (ODDE) building upon the 3 M-Framework developed in the context of distance education along three broad lines of research: ODDE systems and theories (global macro-level); management, organization, and technology (institutional meso-level); and teaching and learning in ODDE (individual micro-level). Based on various bibliographic analyses, the flow of research areas and trends is described. The COVID-19 pandemic is discussed as a turning point that already has a huge impact on research and practice of the entire field of ODDE. According to thematic similarities and dissimilarities in the academic fields of educational technology (EdTech), distance education (DE), and instructional design (ID), four clusters of academic journals are identified with different thematic foci in various educational contexts. This information can be used to guide researchers to choose an appropriate journal in which to submit their work.

**Introduction**

Research into open and distance education and the application of educational technologies have matured over the last 70 years. In the foreword of the book *Online Distance Education: Towards a Research Agenda*, Otto Peters (2014), one of the pioneers who witnessed the development of the field since the 1950s, describes four periods of distance education: the first was characterized by the complete absence of research (except for the works by Charles A. Wedemeyer), the second in the 1960s by the dominance of comparative studies to prove that correspondence education is at least as good as conventional face-to-face education, the third in the 1970s which was shaped by a focus on educational technology and the emergence of open universities, and the fourth in the 1990s which was marked by the emergence of online learning and teaching. Digital technologies have shaped research and development in education substantially by the late 1990s and 2000 onwards. In recent decades, the academic fields of educational technology, distance education, and instructional design have been established with a number of academic journals, conferences, and scholarly societies, as well as universities offering study programs in those areas. To describe this situation, Peters (2014) states: “Looking back at the stark absence of academic research in the 1950s and its modest beginning in the 1960s, we become keenly aware of the enormous progress achieved in online distance education in a relatively short time” (p. xii).

This chapter sets out to explore this progress that has been made in the research field of open, distance, and digital education (ODDE) and to look ahead in the light

of experiences and the shift in 2020/2021 towards online learning and teaching due to the COVID-19 pandemic.

---

### The 3 M-Framework of Research Areas in ODDE

Research into ODDE is a relatively young scholarly discipline emerging in the 1960s and 1970s. High-quality academic journals have existed for only about 40 or 50 years (e.g., the *British Journal of Educational Technology* or *Distance Education*). Around 20 years ago, distance education research was subject to critique (see Saba, 2000) and characterized as “atheoretical and predominantly descriptive” (Perraton, 2000, p. 1). Given that research questions should be posed within a theoretical framework and embedded in a holistic structure of research areas within a discipline, Mishra (1998) called for “a comprehensive and cohesive structure internationally to provide a strong foundation to the discipline” (p. 281). However, in the field of ODDE, there was no validated meta-structure of research topics around that time, i.e., the absence of a map of research areas that would help to organize the body of knowledge in the field. The structure of a research discipline forms the foundation for identifying gaps and priority areas for researchers.

In order to meet this need and to better describe the broad and interdisciplinary nature of the field, Zawacki-Richter (2009) carried out an international Delphi study to develop a validated framework of research topics that became later known as the 3 M-Framework. Three broad categories of research were identified from the Delphi study:

- Macro-level: distance education systems and theories (the global system level)
- Meso-level: management, organization, and technology (the level of educational institutions)
- Micro-level: teaching and learning in distance education (the individual learner and teacher level)

Along those lines, 15 research areas were identified on the 3 levels that were further elaborated by a team of international scholars, administrators, and practitioners in the book *Online Distance Education: Towards a Research Agenda* (Zawacki-Richter & Anderson, 2014) (see Table 1).

According to Anderson and Zawacki-Richter (2014), a research agenda in any given discipline can be defined as an ongoing, iterative process consisting of six interdependent activities:

1. Quantify what research has previously been done.
2. Review and evaluate that research.
3. Describe new research needs on the basis of the quantification and evaluation.
4. Prioritize the research needs in a research agenda.
5. Perform and evaluate the new research, and by doing so. . .
6. Redefine the research agenda. (p. 486)

**Table 1** Fifteen research areas in the 3 M-Framework

Research level	Research area
Macro-level: distance education systems and theories	<ol style="list-style-type: none"> <li>1. Access, equity, and ethics</li> <li>2. Globalization of education and cross-cultural aspects</li> <li>3. Distance teaching systems and institutions</li> <li>4. Theories and models</li> <li>5. Research methods in distance education and knowledge transfer</li> </ol>
Meso-level: management, organization, and technology	<ol style="list-style-type: none"> <li>6. Management and organization</li> <li>7. Costs and benefits</li> <li>8. Educational technology</li> <li>9. Innovation and change</li> <li>10. Professional development and faculty support</li> <li>11. Learner support services</li> <li>12. Quality assurance</li> </ol>
Micro-level: teaching and learning in distance education	<ol style="list-style-type: none"> <li>13. Instructional design</li> <li>14. Interaction and communication in learning communities</li> <li>15. Learner characteristics</li> </ol>

The structure of the 3 M-Framework is an important foundation for developing research agendas for individual researchers and scholars, research departments and institutions, and even national and international research cooperations. It is especially helpful to complete the first three tasks – to quantify what has been done in each area of the discipline, to review that research, and to identify gaps and priority areas for future research.

Before we look into the content of research publications to describe trends and research priorities, we provide an overview of the different academic journals in ODDE.

---

## Thematic Scope of Academic Journals in ODDE

Research and development in the field of ODDE is addressed by a wide range of researchers, from a variety of disciplines. In the following section, we report hitherto unpublished findings from a cluster analysis of journals that was conducted in a research project led by the first author of this chapter. The study assumed that there are separate research communities in the broader field of ODDE, i.e., researchers with a background in distance education, educational technology, and instructional design. The identification of these clusters helps to understand the structure of the discipline(s). Furthermore, it may further help guide researchers new to publishing in ODDE, such as doctoral students and early-career researchers, to choose an appropriate journal in which to submit their work.

The analysis was based on 10,827 articles published between 2007 and 2016 in 26 educational technology, instructional design, and distance education journals (see

full list of the journals in Appendix A). The journals were selected based on their high reputation and impact in the field. Twenty journals were listed in the 2016 Thomson Reuters Journal Citation Report in the “Education and Educational Research” category. A further six journals were chosen according to West’s (2016) list of important and prestigious journals in the field of instructional design and technology. At this point we have to acknowledge a bias towards English language journals that are indexed in international databases, e.g., journals like *Distances et Savoirs* (French), *Revista de Educación a Distancia* (Spanish), or *Distance Education in China* (Chinese) were not included in this study.

The aim of the analysis was to identify similarities and dissimilarities in the thematic scope of the journals. The cluster analysis is based on the mean correlation of the journals in terms of the relative frequencies of the topics (“concepts” retrieved with a text-mining tool) covered in the publications. For example, a high correlation with the other journals was calculated for the *British Journal of Educational Technology* (BJET;  $\bar{r} = 0.84$ ), making it a very representative journal for the field.

The dendrogram in Fig. 1 presents evidence that a four-cluster solution is appropriate to group the journals based on their thematic similarities.

Table 2 provides an overview of the journals in each of the four clusters, which are sorted according to their size. Table 3 lists the ten most frequent concepts in each cluster. Figure 2 reports the relative frequencies of the 20 most frequent concepts over the 4 clusters. This content-related information is used for the interpretation of the four journal clusters.

### **Journal Cluster 1: Educational Technology, Learning, and Computer Science**

The first and biggest cluster (with over 7000 articles) contains leading, high-impact educational technology journals that cover a broad range of topics associated with instructional design, technology, and computer-supported teaching and learning in all levels of education, among them *Computers & Education* (CAE), the *British Journal of Educational Technology* (BJET), and *Educational Technology and Society* (ETS). There is also a focus on instructional and cognitive psychology research, represented by *Learning and Instruction* (LI), the *Journal of the Learning Sciences* (JLS), and *Instructional Science* (IS). In addition, the more technology-centered and computer science-related journals such as the *IEEE Transactions on Learning Technologies* (IEEEETLT) and *Educational Technology Research & Development* (ETRD) are also in this cluster.

### **Journal Cluster 2: Educational Technology from K-12 to Higher Education**

The second cluster is characterized by general, but smaller, educational technology journals representing about 16% of the articles in the sample, including *Learning*,

**Fig. 1** Dendrogram of journal clusters, 2007–2016 (N = 10,827) (for abbreviations see Appendix A)

*Media and Technology* (LMT); *Technology, Pedagogy and Education* (TPE); and the *Journal of Computing in Higher Education* (JCHE). The scope of these journals is related to the application of educational technologies ranging from K-12 to higher education settings. However, in contrast to cluster 1, these journals have a stronger focus on the school context: *teacher*, *school*, and *teaching* are among the ten most frequent concepts (see Table 3).

**Journal Cluster 3: Distance Education in the Context of Higher Education**

This cluster is characterized by journals that focus on research into distance education and student learning in online courses, such as *Distance Education* (DE) or the

**Table 2** Four journal clusters over 10-year and 5-year periods<sup>a</sup>

10	Technology	Online	Learners	Development

*American Journal of Distance Education* (AJDE). In terms of their relative frequencies (see Fig. 2), *students*, *online*, and *course* are the most prevalent terms in these journals. The concept of *distance* does not appear in the upper 20 concepts in the other clusters at all. Contrary to prior assumptions, the journal *Internet and Higher Education* (IHE) is categorized in this cluster. It does not share the same distance education background as the other journals; however, its content-related proximity may be explained by the fact that the other journals in this cluster also focus on the higher education context. Another reason may be the widespread use of distance education and online learning in higher education and the frequent use of technologies such as the Internet in these processes.

**Fig. 2** The 20 most frequent concepts, unweighted over the 4 clusters

## Journal Cluster 4: Technology-Enhanced Learning in School Settings

The two journals that constitute the smallest cluster, *Contemporary Issues in Technology & Teacher Education* (CITTE) and the *Journal of Technology and Teacher Education* (JTTE), clearly stand out, as they explicitly deal with topics related to teacher development and the design of technology-enhanced learning in school settings and subjects. The concepts of *teacher* and *classroom* show the highest relative frequencies (see Fig. 2), and the terms *professional* and *development* are among the ten most frequent concepts, together with *teacher* on the top of this list (see Table 3). Neither journal is listed in the Social Sciences Citation Index (SSCI).

Journals are one of the crucial means for the diffusion of scientific knowledge, and they can be considered “as indicators of the intellectual state of any given branch of knowledge and can be further used to identify the epistemic status of any discipline” (Bozkurt, 2019, p. 497). The results of the analysis confirm that ODDE is an interdisciplinary field and a discipline with many intersection points with educational technology (Bozkurt, 2019; Bozkurt & Zawacki-Richter, 2021).

With this understanding of the overall landscape of academic journals in ODDE, we can now turn towards reviewing the research trends, patterns, and areas covered in the scholarly publications.

## Research Trends Emerging in Content Analysis and Systematic Reviews

The 3 M-Framework was the starting point for a number of bibliographic studies to quantify and review ODDE research. The first review that followed the Delphi study was published by Zawacki-Richter, Baecker, and Vogt (2009), who reviewed 695 articles in the time period between 2000 and 2008 in 5 major peer-reviewed journals: *Open Learning* (OL), *Distance Education* (DE), the *American Journal of Distance Education* (AJDE), the *Journal of Distance Education/International Journal of E-Learning & Distance Education* (JDE/IJEDE), and the *International Review of Research in Open and Distance/Distributed Learning* (IRRODL).

The major outcome of this study was a frequency tabulation of the research areas covered in the publications revealing a strong imbalance: the micro-perspective (teaching and learning in distance education) is highly overrepresented. Over 50% of all articles deal with the top three issues, interaction and communication in learning communities (17.6%), instructional design (17.4%), and learner characteristics (16.3%), whereas other important areas (e.g., costs and benefits, innovation and change management, or intercultural aspects of distance learning) are dreadfully neglected. This finding was also confirmed by other studies, for example, in a follow-up systematic review study of 861 articles published between 2009 and 2013 (Bozkurt et al., 2015). The results of these studies demonstrate that while some research areas are used widely, some others are neglected (see Fig. 3). Besides, the top three research areas identified by Zawacki-Richter et al. (2009) remain unchanged in Bozkurt et al.'s (2015) study. This view implies that there is a need to pay close attention to the ignored research areas if the field intends to explore different domains and build a solid basis for further growth. It is noteworthy to highlight that the *educational technology* research area is listed with the highest score on the meso-level which justifies the close relationship between the distance education and educational technology journals.

## Quantitative Content Analysis and Text-Mining

Moving beyond the quantification of research areas and topics and the mapping of publication and authorship patterns, content analysis, text-mining, and topic modelling (see Krippendorff, 2013; Silge & Robinson, 2016) of academic journals allow for deeper insights into the development and flow of research trends over time. Content analysis examines the conceptual structure of text-based information and detects the most frequently occurring themes within large amounts of data. Fisk, Cherney, Hornsey, and Smith (2012) conclude that computer-aided content analysis is a suitable method by which to map a field of research. Thus, content analysis is an invaluable means of interpreting and coding the content of a research discipline and identifying gaps and priority areas for future research.

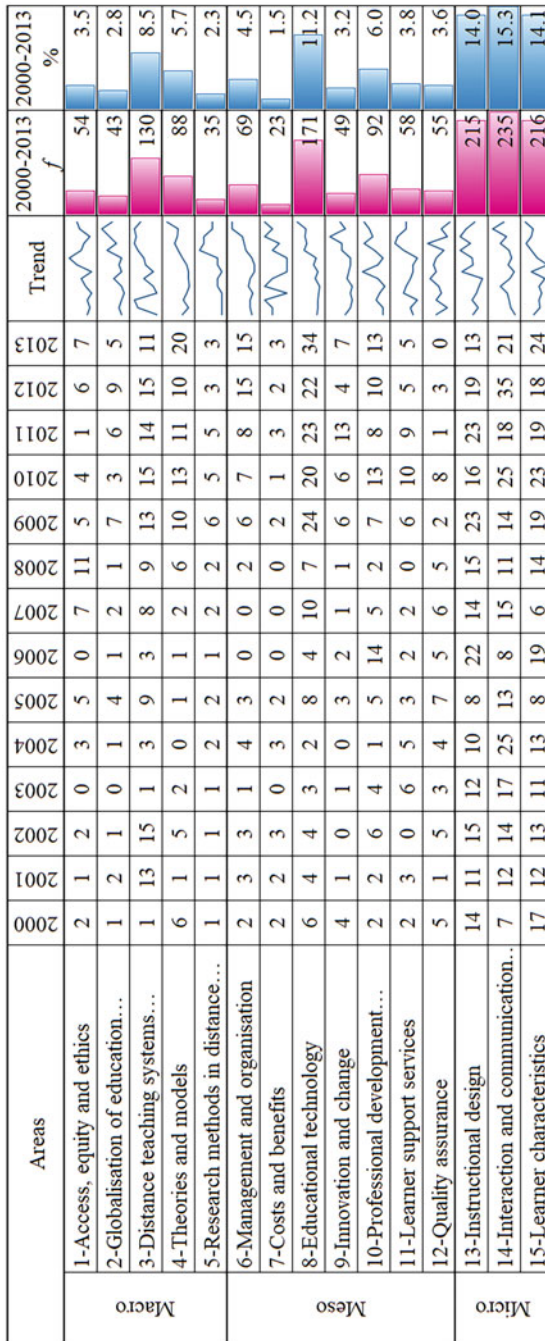

Fig. 3 The trends of 3 M-Framework (adopted from Bozkurt et al., 2015; Zawacki-Richter et al., 2009)

As West (2011) observes:

There is practical value to understanding where we are right now, and where we have been in the very recent past. To understand this, it can be helpful to review some of the journals in our field to see what conversations are being held, research being conducted, tools being developed, and theories being accepted. (p. 60)

Special software is available to support the analysis of huge amounts of text-based data, for example, the text-mining tool Leximancer™. The software locates core concepts within textual data (conceptual analysis) and identifies how these concepts interrelate (relational analysis) by the frequency with which words co-occur in the text. Leximancer™ then produces a visual map, which clusters similar concepts that co-occur in close proximity (thematic regions). Packages for text-mining and topic modelling are also available for the open and free statistical programming language R (see: <https://www.r-project.org>), e.g., the *tidytext* package (Silge & Robinson, 2016).

Content analysis and text-mining studies in the field of ODDE are available based on publications in the major and most influential journals. By analyzing 515 research articles published in the journal *Distance Education* between 1980 and 2014, Zawacki-Richter and Naidu (2016) were able to identify the following main themes over seven 5-year time periods: professionalization and institutional consolidation (1980–1984); instructional design and educational technology (1985–1989); quality assurance in distance education (1990–1994); student support and early stages of online learning (1995–1999); the emergence of the virtual university (2000–2004); collaborative learning and online interaction patterns (2005–2009); and interactive learning, massive open online courses (MOOCs), and open educational resources (OER) (2010–2014). The concept map in Fig. 4 shows the major topics (concepts in five thematic regions) covered in the articles published over 35 years (1980–2014). Not surprisingly, the journal publishes *research* on open and distance *education* with a focus in the higher education context. The other two major topics covered in the articles (i.e., *students* and *learning*) are connected via the theme *interaction*. Learning is seen among these articles as a social process that is facilitated by interaction among participants. Furthermore, the provision of opportunities for interaction, communication, and collaboration between students and their teachers, as well as among students via two-way media, is proposed as constituent element of distance education. In such settings, teaching and learning are seen as the result of careful design and orchestration of the learning environment, communication processes, learner support, and use of learning materials.

A similar review was conducted for the journal *International Review of Research in Open and Distributed Learning* (IRRODL). Zawacki-Richter, Alturki, and Aldraiweesh (2017) analyzed 580 articles published between 2000 and 2015 and identified 3 broad themes emerging over this 15-year period: the establishment of online learning and distance education institutions (2000–2005); widening access to education and online learning support (2006–2010); and the emergence of MOOCs and OER (2011–2015). In the field of educational technology, Zawacki-Richter and

**Fig. 4** Concept map of 515 articles published between 1980 and 2014 in the journal *Distance Education* (Zawacki-Richter & Naidu, 2016, p. 249)

Latchem (2018) reviewed 40 years of publications in the leading journal *Computers & Education*. The content analysis of abstracts and titles of 3674 full articles published between 1976 and 2016 revealed that research progressed through 4 distinct stages, reflecting major developments in educational technology and theories of learning with media: the advancement and growth of computer-based instruction (1976–1986); stand-alone multimedia learning (1987–1996); networked computers as tools for collaborative learning (1997–2006); and online learning in a digital age (2007–2016).

Mishra (2019) used a combination of bibliometrics and thematic content analysis to review contributions in the first 10 years to the *Journal of Learning for Development* (JL4D). He reports that JL4D’s major focus is placed on student learning, teachers and teaching, and contextual needs in education, while citation analysis shows that “the contributions are by and large influenced from the field of educational technology in general and experts in the field of open and distance learning” (Mishra, 2019, p. 173). Thus, the journal is rooted in the field of open and distance

learning, addressing a niche of research in the area of innovations in learning leading to development.

### **Citation and Journal Network Analysis**

Social network analysis (SNA; Wasserman & Faust, 1994) of citations is another technique to explore relationships in scholarly knowledge networks. Garfield (1972) described journal networks as a “communication system” that reveals the intellectual structure of a discipline. In journal network analysis, the nodes in the scientific network are journals (actors), and the relations (ties) are based on citations (Narin, Carpenter, & Berlt, 1972). Bozkurt et al. (2015) used SNA to visualize the relationships between keywords of articles in distance education journals and found that the majority of published research deals with research on the micro-level, covering topics and issues such as ‘teaching’ and ‘learning’ processes in online distance education. Wolf, Andrzejewski, Clark, and Forney (2020) analyzed the qualitative research literature in distance education by constructing a two-mode network matrix of qualitative articles by theories and methodologies. They showed how the theories and methodologies co-occurred. For example, case studies are often linked with social constructivism, the Community of Inquiry, transactional distance, and self-regulated learning. Park and Shea (2020) applied co-citation and cluster analysis to identify trends in online, distance, and blended learning research based on 5699 articles with 159,891 references retrieved from the Web of Science (WoS). The dataset was divided into two time spans from 2008 to 2012 and from 2013 to 2017. The study revealed that literature reviews, meta-studies on distance education, and research into communication patterns in asynchronous discussion were most cited in the first time period. In the second period, researchers turned their attention to online learner’s satisfaction and self-regulation, informal learning, and MOOCs. In the entire 10-year period, the Community of Inquiry framework was the most prevalent theoretical foundation in the publications, a finding confirmed by Bozkurt (2019) and Bozkurt and Zawacki-Richter (2021).

### **Systematic Reviews and Meta-analysis Studies**

Drilling further down into content and research findings, systematic reviews (Gough, Oliver, & Thomas, 2017; Petticrew & Roberts, 2006; for systematic reviews in education, see Zawacki-Richter et al., 2020), including or not including meta-analysis (Borenstein, Hedges, Higgins, & Rothstein, 2009), are the gold standard to synthesize research to inform evidence-based policy and practice. As Hammersley (2020) noted, systematic reviews became influential “in the context of the longstanding, and challenging, issue of how to ‘translate’ research findings into reliable guidance for practical decision-making – to determine which policies, programs, and strategies should (and should not) be adopted” (p. 23). The methodological approach of systematic reviewing became influential by the

emergence of the evidence-based medicine movement in the second half of the twentieth century. Systematic reviews are also being carried out more and more frequently in the educational sciences. Dowd and Johnson (2020) report an increase in the number of systematic reviews published in the leading journal *Review of Educational Research* with a proportion of 41% in 2017 and 43% in 2018.

Rather than providing a general overview of research trends and scholarly networks in a given discipline, systematic reviews aggregate findings of primary studies to answer a review question, indicate the direction or size of effect in a meta-analysis, or qualitatively arrange research findings in a configurative synthesis: “Rather than looking at any study in isolation, we need to look at the body of evidence” (Nordenbo, 2010, p. 22). In contrast to traditional or narrative literature reviews, which are criticized as being biased and arbitrary, the aim of a systematic review is to carry out a review that is rigorous and transparent in each step of the review process, thereby making it reproducible and updatable.

Meta-analysis has a long tradition in ODDE research (see Bernard, Borokhovski, & Tamim, 2019) in comparing distance education with traditional face-to-face education (Bernard et al., 2004) or comparing learning outcomes (Zhao, Lei, Yan, Lai, & Tan, 2005) and learner performance (Means, Toyama, Murphy, Bakia, & Jones, 2009) between these two modes. Previous meta-analysis studies have focused on the impact of media on learning (e.g., see the second order meta-analysis by Tamim, Bernard, Borokhovski, Abrami, & Schmid, 2011), while meta-synthesis studies focused on factors influencing students’ experiences (Blackmon & Major, 2012), course environments, learning outcomes, learners’ characteristics, and institutional and administrative aspects (Tallent-Runnels et al., 2006).

Historically, it has often been the case that a triggering event at the macro- or meso-level has led to a new research direction at the micro-level. The next section will deal with these alternating research waves in ODDE.

---

## Alternating Research Waves

Based on the different levels of 3 M-Framework, waves of alternating institutional and individual research perspectives were proposed by Zawacki-Richter and Naidu (2016). As an extended and updated version, four waves covering the past 40 years are presented in Fig. 5. Responding to a triggering event such as the foundation of open universities, quality problems at distance teaching institutions, or the emergence of virtual universities, researchers turned their attention to issues on the micro-level of teaching and learning. The four waves can be labelled as follows: (1) the consolidation of distance teaching institutions and instructional design; (2) quality assurance and student support; (3) virtual universities, online interaction, and learning; and 4) artificial intelligence, big data, and intelligent support systems.

**Fig. 5** Alternating research waves over time (based on Zawacki-Richter & Naidu, 2016)

## **The First Wave: Institutional Consolidation and Instructional Design**

The establishment of open universities and distance teaching institutions around the world in the 1970s and 1980s was a critical milestone in the history of ODDE. This revolutionary new form of educational practice posed an enormous challenge on organizational management and professional practice. The idea of ODDE was embodied by these developments and found an opportunity to apply its theory and practice through a systems view (Moore & Kearsley, 2005). The temporal, spatial, and transactional distance between learners and learning sources (i.e., other learners, instructors, and learning materials) required the development of curriculum and instructional design strategies to effectively and efficiently deliver education.

## **The Second Wave: Quality Assurance and Student Support**

With the removal of temporal and spatial barriers, more learners had the opportunity to access education. This situation also led to the emergence of massification in ODDE with mega universities (Daniel, 1996) of more than 100,000 or even millions of students. With the growth of distance teaching provision, quality problems emerged, resulting in low completion rates and dropout. It is not surprising to see that research focused on quality assurance and the implementation of learner support services along the student life cycle (see Reid, 1995). The ultimate purpose of quality assurance is to provide the best possible solutions to learners, and this requires a systematic approach, internal and external quality mechanisms, and policies and strategies in place. The nature and characteristics of learning processes in ODDE require a comprehensive and operational learner support system.

## **The Third Wave: Virtual Universities, Online Interaction, and Learning**

The proliferation of information and communication technologies around the new millennium, and more specifically online networked technologies, allowed ODDE to expand its boundaries. Online learning is beginning to be seen as the new face of distance education. Researchers are fascinated by the enormous opportunities that the new information and communication technologies afford for collaborative online learning and teaching. The capacity increase that emerged with digital solutions has expanded the boundaries of not only education but also many concepts. For instance, openness, flexibility, and accessibility took new forms such as MOOCs, OER, and practices. With the integration of online distance learning, the boundaries between distance education institutions and conventional education providers are blurring, moving ODDE into the mainstream of education (Xiao, 2018).

---

## The Fourth Wave: AI, Big Data, and Intelligent Support Systems

With the increasing digitalization and the spread of online technologies, a massive volume of (big) data has been produced that can be managed, processed, and analyzed. Artificial intelligence (AI) methods such as machine learning or deep learning are already used for learning analytics to identify students at risk (early warning systems), for automated assessment, and to design adaptive learning environments and intelligent tutoring systems (Zawacki-Richter, Marin, Bond, & Gouverneur, 2019). Despite the enormous potential of AI in education, challenges remain in terms of ethical implications and issues of privacy and data protection.

---

## COVID-19 Pandemic: The Turning Point

As noted earlier, alternating research waves are shaped by significant developments in the history of the ODDE triggered by technological advances in the society. In this sense, we consider the COVID-19 pandemic as a turning point for many dimensions of our lives including ODDE. This section, thus, provides reflections from the recent articles which probably affect the future scenarios and identify possible future waves in ODDE.

The COVID-19 pandemic was a wake-up call for all walks of life across the globe, including open, distance, and digital education. The pandemic and its consequences indicate a new future that we can call *the new normal* where radical changes and paradigm shifts are ahead of us (Bozkurt & Sharma, 2020a, 2020b; Xiao, 2021). A recent systematic review about emergency remote teaching and learning in schools during the COVID-19 pandemic reports that the studies were “heavily focused on the impact of lockdown and the COVID-19 pandemic on schools and learning, but particularly on the challenges experienced by teachers as a result of switching to online forms of teaching and learning” (Bond, 2020, p. 204). These challenges were echoed in different studies and included social, psychological, and technological aspects. For instance, Crompton, Burke, Jordan, and Wilson (2021) reported that educational practices, ranging from digital to analog and from online to offline, were mostly dependent on educational technologies. Bozkurt (2022) examined impact of the Covid-19 pandemic and identified three broad themes: (1) educational crisis and higher education in the new normal: resilience, adaptability, and sustainability, (2) psychological pressures, social uncertainty, and mental well-being of learners, and (3) the rise of online distance education and blended-hybrid modes. Bozkurt (2022) further noted that the future of education is being shaped in the present time and there is a need to focus on issues such as digital pedagogies, care and empathy-oriented pedagogies, equity and social justice, and new educational roles in the new normal. In a similar study, Mishra, Sahoob, and Pandey (2021) reviewed research trends in distance and online learning during the COVID-19 pandemic using co-citation analysis and keyword analysis with 330 peer-reviewed research articles and conference papers retrieved from the Scopus database. According to Mishra et al. (2021), the articles mostly cover post-secondary

education (67.9%), whereas research in the context of K-12 education (10.3%) and workplace training and lifelong learning (7.6%) is lacking. They found that the field has focused on remote teaching and learning as a new term to describe online distance education. There has been a focus on educational technologies and their capabilities to support online learners.

These studies show that the COVID-19 pandemic was a turning point and an opportunity to reimagine and redesign education, including ODDE. It is also emphasized that considering teaching and learning are “primarily about human beings, for human beings, and by human beings” (Xiao, 2021, p. 3), there is a need for care and empathy-oriented human-centered pedagogies (Bozkurt & Sharma, 2021).

---

## Conclusions

This chapter provides a comprehensive overview of the flow and development of research in ODDE over time based on the 3 M-Framework of research areas on the macro-, meso-, and micro-level. Earlier bibliographic content analysis and systematic reviews report that ODDE has a clear focus and high research interest on interaction and communication in learning communities, learner characteristics, instructional design (micro-level), and educational technology (meso-level). These results also show which research areas we have examined sufficiently, and which research areas we should focus more on, hence offering clues for setting a future research agenda. Content analysis and text-mining studies demonstrate how the field of ODDE has been advancing and addressing emergent and diverse issues to ensure its sustainability. Through citation and journal network analysis studies, the intellectual growth of ODDE can be tracked, which in turn can guide new studies to build on previous research. In this process, systematic reviews, meta-analyses, and syntheses are conducive to identifying research gaps and priority areas and to informing evidence-based practice and interventions.

The onset of the COVID-19 pandemic in 2020 was certainly a global game-changer that has led to the application of ODDE across the globe in all education sectors. Driven by the societal transformation of digitalization, ODDE had been in the spotlight even before the COVID-19 pandemic – now ODDE has fully entered the mainstream of education. ODDE is now practiced in its different forms across all disciplines and on all educational levels from pre-school to higher education.

Even though the trigger from the COVID-19 pandemic is horrific, the future of ODDE looks bright and promising. In light of this development, it is important to build upon the theory, research, and practice in ODDE to prevent that the wheel is reinvented.

## Abstract

This chapter provides a discussion of big science and little science. An overview of the definitions and uses of each is provided, as well as data collection and analysis practices, inclusive of a range of digital data analysis tools for research projects in open, distance, and digital education. A discussion is also provided on the promises, opportunities, controversies, and complications of big data and little data, as well as the possibilities of working with both forms of data collection. Insights based on the literature are highlighted, providing suggestions for practice when working with big data and/or little data. The chapter concludes with questions and suggestions for further research and implications for open, distance, and digital education that arise from the literature.

**Introduction**

In God we trust. All others must bring data. (W. Edwards Deming, Hanson, 2019)

Student's digital activities generate an enormous amount of data which has led to the pursuit of how to analyze these data to determine if and/or how the information can be used to enhance learning environments (Sin & Muthu, 2015). Often referred to as big science, the central aim is to draw meaningful information from a large volume of data by eliminating the noisy data which can then be used to make better, faster, and smarter decisions (Dahdouh, Dakkak, Oughdir, & Messaoudi, 2018). This information, in turn, can be used to enhance ODDE systems. For example, big data can provide information ranging from enrolment and attrition to course materials and student activities. Indeed, according to Atasoy, Bozna, Sönmez, Akkurt, Büyükköse, and Firat (2020), big science "can solve everyday problems ... [in] education, enable personalized learning for each learner, offer a new type of evaluation and assessment and allow continuous feedback and feedforwards" (p. 145). What big science cannot do, however, is determine if the data have any kind of impact on learner outcomes (O'Brian, 2017). As Prinsloo, Archer, Barnes, Chetty, and van Zyl (2015) note, "... it is clear that in order for big(ger) data to be better data, a number of issues need to be addressed" (p. 284). The issues Prinsloo et al. note revolve around the problem that big data analysis can provide patterns *about* what students do online, but the data cannot *interpret* the patterns and/or determine how the data links to learning theory (see also Maldonado-Mahauad, Pérez-Sanagustín, Kizilcec, Morale, & Munos-Gama, 2018). To address these issues, data triangulation has been suggested, which could include qualitative research methodologies – or little science, which can provide explanatory power using thick, rich data. But like big data, little data also have limitations (e.g., inability to generalize, researcher privileging, sample bias, etc.)

ODDE research that includes the breadth and depth that both big and little science offers provides a more complete set of findings than either can provide singly. ODDE researchers, for example, can use the analysis of big data patterns to gain information on what is occurring, which can then be effectively used with little data (qualitative) methods to provide insights on why. Or, alternatively, ODDE research can use the insights arising from qualitative methods to determine if the data are generalizable to a wider population.

---

**Big Science, Big Data**

Apparently, one of the hottest things anyone can become these days is a data scientist (Fruhlinger, 2019). A data scientist collects and analyses big datasets of structured and unstructured data. Most often, a data scientist will have knowledge of computer

science, statistics, and mathematics. They use their knowledge and skills to find patterns, identify trends, and manage data – or, quite simply, make sense of an extremely large amount of messy data that do not easily fit into existing database software. Mills (2018) notes that big data has “captured the imagination of researchers worldwide, with a proliferation of digital media rendering extremely large datasets more rapidly searchable, analysable and shareable” (p. 591). Josh Wills (a senior director of data science at Cloudera) describes himself as “. . . a data janitor. That’s the sexiest job of the twenty-first century” (Harnham Blog and News, n.d.). Dan Ariely also notes the allure of big data in a tweet (Ariely, 2013): “Big Data is like teenage sex: everyone talks about it, nobody really knows how to do it, everyone thinks everyone else is doing it, so everyone claims they are doing it.” An overview of the research literature on big data indicates that, as Ariely aptly tweeted, not only does no one really know how to do it; there is little consensus on what it is, as well as how to define it.

The following section provides a synopsis of the literature on how big data are described and/or defined by researchers and practitioners, as well as their uses. As this section illustrates, one cannot assume there is a shared understanding of definitions for big data, uses, and/or how the data are collected and analyzed. When the ODDE researcher is choosing and using big data, also referred to as big science, it is essential at the onset to decide on a definition and intended use, with a clear and lucid description of how the data will be collected and analyzed.

## Big Data Defined

Put simply, big data are human artifacts generated and shared through technological environments where (almost) anything can be captured digitally and collected as data, which Mayer-Schönberger and Cukier (2013) referred to as “datafication.” The phrases “big data” and “big science” have been around since the 1990s, though it would appear no one is certain exactly when it emerged and/or who coined the phrases (Big Data Fundamentals, 2019). While still a relatively new construct in the research area, big data has already become a somewhat prosaic, all-encompassing phrase used to describe a variety of different purposes about enormously gigantic data sources. Big data has been used to describe everything from the collection and aggregation of large amounts of data to vast amounts of digital analysis aimed to identify patterns in human behavior for researchers and industries alike (Favaretto, Clercq, & Elger, 2020). This is in addition to uses aimed to improve science and research; optimize performance; improve health care; enhance machine and device performance, security, and law enforcement; and, most recently, provide essential information on the pandemic which has guided public health decisions. The use of big data has shown to have the potential to identify key information for improved decision-making processes, and, as such, it is easy to understand why it has also attracted the attention of ODDE researchers.

The most frequently cited definition of big data is by the National Science Foundation (NSF, 2012). The National Science Foundation states:

The phrase “big data” in this solicitation does not refer just to the volume of data, but also to its variety and velocity. Big data includes large, diverse, complex, longitudinal, and/or distributed data sets generated from instruments, sensors, Internet transactions, email, video, click streams, and/or all other digital sources.

The problem with this definition is that, as Favaretto et al. (2020) note, it is “loaded with conceptual vagueness” (para. 1). Essentially, big data is comprised of “. . . any collection of data or datasets so complex or large that traditional data management approaches become unsuitable” (IPSOS Encyclopedia, 2016). A study conducted by Favaretto et al. investigated researchers’ understanding of the big data phenomenon over the last decade. The findings of this study revealed that many of their participants were uncertain how to define big data, though there was some agreement on using the traditional “Vs” definition – though, again, there was no agreement on the number of Vs. Depending on who one reads, the Vs definition of big data includes two to seven of the following: *volume* (*big*, extremely big, data – or very large datasets consisting of terabytes, petabytes, zettabytes of data – or larger), *variety* (multiple datasets that include structured and unstructured data – such as pictures, voice recordings, tweets, etc.), *veracity* (trustworthiness which includes the increasingly complex data structure, anonymities, imprecision, or inconsistency in large datasets), *velocity* (high volume of incoming data with nonhomogeneous structure), *value* (extracting data that lead to the discovery of a critical causal effect that results in an important new discovery), *variability* (the meaning of the data are constantly changing), and *visualization* (presentation of data that is readable) (Sivarajah, Kamal, Irani, & Weerakkody, 2017).

In the study by Favaretto et al. (2020), most of the participants (who were big data researchers) preferred a practical definition that linked to practice such as the processes of data collection and processing. Also noted in the findings is that the participants, on the whole, had an uneasiness with respect to the use of the term big data, recognizing that this field is a “shifting and evolving cultural phenomenon. Moreover, the currently enacted use of the term as a hyped-up buzzword might further aggravate the conceptual vagueness of big data” (para. 4). As Favaretto et al. also emphasize, “big data is a term that has invaded our daily world. From commercial applications to research in multiple fields, big data holds the promise of solving some of the world’s most challenging problems” (Introduction, Para. 2). Given the shifting ways big data are collected, analyzed, and used, it would seem a definition of big data needs to be linked to its use. At this point in time, researchers are using big data to “analyse and group data, create correlations, look for clusters and essentially gain insights into data, that we cannot get from standard reporting of the tools and systems creating and storing the data” (Sivarajah et al., 2017, p. 266). Given how big data are currently being used in ODDE research, it can be defined as the analysis of an extremely large group of data that generates correlations and/or clusters, providing insights otherwise unobtainable from standard collection and analysis. While there is no agreed-upon threshold for big data (upper and lower limits depend on the kind of data collected and time span of the data collected), “standard collection” of data can be understood as data created and collected that can be analyzed through

traditional data management approaches (e.g., existing database management software such as Oracle, FoxPro, FileMaker Pro, Microsoft Access, etc.). Big data, then, are large amounts of data (e.g., terabytes, petabytes exabytes, and larger) created and collected overtime, and the data are analyzed using big data analytic software (e.g., Domo, Grow, Toucan Toco Data, Python, R, etc.).

## How Big Is Big Data?

Quite simply, big data is very, very big. Just how big” very, very big” is difficult to determine because the ways the data are collected, analyzed, and used are constantly changing. A report provided by Dobre and Xhafa (2014) determined that the world produces about 2.5 quintillion bytes of data. How big is quintillion byte of data? One exabyte equals one quintillion bytes, so one exabyte equals one billion. A Google search on the Internet indicates (depending on the site visited) that in 2020, we (people who use digital technologies) created about 1.7 megabytes of data every second and by the end of 2020, approximately 44 zettabytes comprised the entire digital universe. The eighth edition of Domo’s “Data Never Sleeps” report estimated that we created 2.5 quintillion data bytes, daily, in 2020 (fyi: there are 18 zeros in a quintillion). Raconteur (2021) estimates there will be 483 exabytes of data generated each day by 2025. According to the World Economic Forum (2019), there are 40 times more bytes in 483 exabytes than there are observable stars in the universe.

There appears to be no end in sight on the ways big data continues to challenge our imagination with respect to limits and by association the ways in which an ODDE researcher can use big data to gain relational information about ODDE. For example, Wen, Zhang, and Shu (2019) assert that through the use of a chaos optimization and cognitive learning model they developed, it is possible to gather information about student attributes (e.g., motivation, task demands, efficacy, interaction, time on tasks, learning styles, etc.) to potentially improve the ODDE learning experience. As Wen et al. illustrate (see also Huda, Maselena, Atmotiyoso, Siregar, Ahmad et al., 2018), it is possible to optimize the chaos, of large, incomplete, noisy, fuzzy, big data to uncover potentially useful information which can be used to not only enhance the learning experience but also assist in market strategies, risk reduction, administrative tasks (e.g., registrations), resource and infrastructure management, and policy decisions. Another example is the perennial issue of student attrition in ODDE which, as O’Brian (2017) aptly notes, is often only identified after an exam is missed or a student is no longer logging into the learning system. It is possible that big data analysis can enable early identification of students who are at risk (dropout, flunkout, time-out), providing opportunities for interventions. A study by Zhang, Gao, and Zhang (2021), for example, used clickstream data to investigate student attrition in ODDE. Their findings revealed that introductory learning resources, scaffolding, and embedded assessment can mitigate attrition. Kyritsi, Zorkadis, Stavropoulos, and Verykios (2019) also found that the use of discussion fora is correlated to higher achievements on course assignments, quizzes, and exams; this, in turn, could reduce attrition due to failure.

As these examples illustrate, the greatest contribution of big data is the ability to gather predictive data which can assist in strategic decision-making, as well as guide students through their programs and course selections. In turn, this could also improve student success and satisfaction, increase the quality of teaching resources, and lower costs (Dahdouh et al., 2018; Rienties, Cross, Marsh & Ullmann, 2017).

To assist in understanding how to use the enormous amounts of data to enhance ODDE, data scientists use data visualization tools. Data visualization tools provide a representation of data in a graph, chart, or other visual formats that illustrates relationships of the data through the use of images. The visual relationships, then, allow us to identify and interpret trends and patterns, which can provide predictive analysis. For example, as Atasoy et al. (2020) note, it is obvious that a better understanding of the student (e.g., demographics, grades, attendance, log data, interaction, time spent in online, and responses to interventions and learning designs) would benefit students and “thus the educational institution’s retention and success rate” (p. 147). According to Atasoy et al., it is possible to use this information to:

... predict learners’ performance, identify undesirable learning behaviors and emotional states, ascertain and monitor learners at risk and provide appropriate help for learners. It can also stipulate learners with learning features that will make their learning experience more personal and engaging, encourage reflection and development and stronger descriptions of patterns ... there will be personalized theories and philosophies that fit each learner and application of a student-centric, inquiry-based model of analytics will put the tools and premises of analytics into the hands of learners and empower them as metacognitive agents of their own learning ... Also, the collection of large amounts of data, big data, can help educators and system makers to identify patterns which will enable tailored education for each individual. By this way, pedagogy and andragogy can break their chains; become free from “one-size-fits-all” principles. (pp. 159–160)

## Data Deluge

The data deluge phenomenon refers to the tsunami of complex, unstructured, and structured data available alongside a perception that we can simply, and easily, mine whatever data we are interested in, analyze it, and voila: we have novel insights and significant findings from an unprecedented scale of large data available. This is a misguided assumption.

Mayer-Schönberger and Cukier (2013) describe a transition that is occurring in research practices from causal inference approaches to analyzing data to data analysis practices based on the advantages of conducting correlational analysis with extremely large datasets. There is no question, as Gejingting, Ruiqiong, Wei, Libao, and Zhenjun (2019) observe, big data are capable of providing powerful functions for correlation analysis. The strength in correlational analysis of big data is the probability meanings; hence, if the correlation coefficient is large, it can establish probability with a high degree of accuracy. However, there are well-known limitations with correlational research, including the well-known limitation that not all correlations are meaningful (e.g., just because two variables are correlated does not

mean a causation relationship exists between them). It is true that big data will return results on (almost) anything the researcher asks. Unfortunately, if researchers ask the wrong question or are just “going fishing” for significant relationships, big data will return significant results – regardless of whether causation exists or not. It is also well-known that big data are prone to data breaches, there are a lot of data behind firewalls that are not available for data analysis resulting in skewed and/or an incomplete analysis of the data, and the tools used to collect big data are inexact. As Fan, Han, and Liu highlight (2014): “. . .the massive sample size and high dimensionality of big data introduce unique computational and statistical challenges, including scalability and storage bottleneck, noise accumulation, spurious correlation, incidental endogeneity, and measurement errors” (para. 1), leading to mistaken statistical inferences and incorrect scientific conclusions.

For reasons noted above, several ODDE researchers have cautioned about the possible perils of working with big data. Unsupported assertions with unbridled enthusiasm about big data have been challenged and continue to experience increased criticism. The following is such a quote by an enthusiastic researcher who declared that big data will end the need for theory and make scientific methods obsolete:

. . . massive amounts of data and applied mathematics replace every other tool that might be brought to bear. Out with every theory of human behaviour, from linguistics to sociology. Forget taxonomy, ontology, and psychology. Who knows why people do what they do? The point is they do it, and we can track and measure it with unprecedented fidelity. With enough data, the numbers speak for themselves. (Anderson, 2008)

In response to such assertions, Crawford (n.d.) published myths about big data arguing, among other things, it is a mistaken assumption that when the numbers are large enough, the data speak for themselves. Other criticisms include discrimination, asynchronous power between social groups, and invasion of privacy (e.g., Leurs & Shepherd, 2017; Mills, 2018). Boyd and Crawford (2012) have asked critical questions about the analysis and use of big data, including the following: Are big data changing our definition of knowledge? Are big data misleading us with respect to objectivity and accuracy? Are big data better data? Are big data meaningful without context? While the data are available for collection, is it ethical? Is the use of big data creating a new digital divide? On a darker side, Leurs and Shepherd (2017) question who, exactly, benefits from the correlative analysis of big data? And who suffers? They describe the issues with “runaway data that asymmetrically order our social . . . institutions through hidden algorithmic practices that tend to further entrench inequality by seeking to predict risk” (p. 211).

To be clear, big data are remarkable at ubiquitously collecting a vast array of human behaviors available in a digital format. However, meaningful research is more than just a matter of getting a ticket dump and using data analytic and visualization tools. It is essential to know and understand the context, who is contributing to the data, who is not, how it is being used, and what processes it is supporting. Big data, in and of itself, is meaningless.

## Little Science, Little Data

As illustrated above by Anderson (2008), there are practitioners and researchers who believe that big data will render the data arising from small-scale research (most data collected in qualitative studies would be considered small-scale research) inadequate and perhaps even become an obsolescent form of data collection. Of course, these assertions have been challenged, most often countering with the argument that complex research questions about human behavior and society require identification of patterns within contextualized data and these data are, typically, located in the minds, artifacts, and/or documents of individuals and organizations – not always available in a digital format (Mills, 2018). Access to these data relies on the willingness of individuals and organizations to share this information (e.g., opinions, perspectives, documents, etc.). Furthermore, researchers are (typically) awarded funding, and published in competitive journals, when new insights from original data are produced, providing solutions for current issues and problems (Borgman, 2015). As Mills notes:

... big data has potential for optimizing and advancing the efficiency of research and scholarship, more than ever before there is the need for reason, theorization, problem-solving, originality, and social justice in determining what questions can be served by the data, and whose interests they serve. A ready supply of statistics and the vast scale of data in the digital world is not particularly useful for answering the kinds of research questions that people in the social sciences are asking. (p. 595)

By way of an example, a problem in Canada is the provision of access to ODDE opportunities in rural and remote communities who continue to have limited and/or unreliable Internet access. Big data cannot provide insights to issues where these kinds of digital black spots exist. Hence, there are contexts and environments that big data cannot capture; the need for small science will always exist.

## Little Data Defined

Unlike big data, there is little controversy with respect to understanding little data. Little data, or qualitative research, is (mostly) an agreed-upon construct. While all research involves collecting, analyzing, interpreting, and writing the results of a study, qualitative research involves an inquiry process of understanding a social or human problem, based on building a complex, holistic picture, formed with words, reporting detailed views of informants and conducted in a natural setting (Creswell, 1994). Denzin and Lincoln (1994) elaborate further, describing qualitative research as a multi-method, interpretive, and naturalistic research approach. In its simplest sense, then, qualitative research seeks to understand individuals' social reality.

## How Small Is Small Data?

Because qualitative researchers collect words, documents, artifacts, and/or information as their data, quantifying the data and determining statistical significance are not

a concern (Onwuegbuzie & Leach, 2007). Rather, qualitative researchers are concerned about gathering enough data to achieve “conceptual power” (Constantinou, Georgiou, & Perdikogianni, 2017) which, in turn, provides detailed descriptions to ensure the findings are transferable, rather than generalizable. As such, the quality of data is more important than the quantity of data collected. Where the waters get muddy in qualitative research is just how big should the data be? And how small is too small? There is certainly no shortage of scholarly literature on this front or pedestrian opinions available on the Internet.

Qualitative data can include historical documents, observations, visual data, books, and texts – to list a few. However, by far, the most frequent data collected by qualitative researchers are the words provided by purposively selected individuals and/or group(s) of people. The issue revolving around how many individuals or groups of individuals are needed to achieve rigor, credibility, and trustworthiness is where there is less consensus. Depending on whom one reads, sample sizes involving individuals and/or groups can be as small as one person (Baker & Edwards, 2012) in, for example, biographical research. Alternatively, recommendations by Becker et al. (2002) argue that “In the case of 2-4-h interviews . . . [the] rule of thumb is that fewer than 60 interviews cannot support convincing conclusions and more than 150 produce too much material to analyse effectively and expeditiously” (p. 23), while others conclude there are no rules. Baker and Edwards conducted interviews with experts in the field, asking them “how many qualitative interviews is enough?” With few exceptions, the answers by the experts selected for this study involved explaining that it depends, concluding as one participant mused:

But in general the old rule seems to hold that you keep asking as long as you are getting different answers, and that is a reminder that with our little samples we can't establish frequencies but we should be able to find the range of responses . . . the best answer is to report fully how it was resolved. (Bakers & Edwards, pp. 3–4)

## Data Saturation

Data saturation is a term which is used for what the above participant refers to as “the old rule.” According to Glaser and Strauss (1967), data are saturated when the topics or themes drawn from the researcher(s)’ dataset are repeated and the data ceases to provide new information or themes relating to the research problem. There is general agreement in the research community on how data saturation is defined, as well as consensus that data saturation contributes to ensuring the data collection and analysis are robust and valid. What is rarely in the literature on data saturation, as well as in published research studies, is a description of how data saturation is achieved. It should also be noted that what is actually saturated is not the data, per se, but the categories/topics and themes. As Constantinou et al. (2017) note, words cannot be saturated because the words used will be different across participants; what researchers actually analyze are the commonalities of the words and their meanings among participants. Technically, then, it is themes saturation, not data saturation. This noted, it has been argued that thematic saturation can be attained the same way:

when there is cessation of new themes and categories. Yet, as Morse (2015) observes, how to achieve themes saturation is not always well understood by researchers, noting it is typically comprised of an abstract description, vacant of a detailed process.

Constantinou et al. (2017) reviewed the literature on different approaches for reaching saturation; they found a limited number of papers on how to conduct saturation. Depending on the processes described, this literature indicates that saturation can be achieved after 8–17 interviews (e.g., Bowen, 2008; Francis et al., 2010; Guest, Bunce, and Johnson, 2006). The processes presented for saturation were deemed in several ways as inadequate, with the biggest issue revolving around the question of interview order. Specifically, if the interviews were conducted in a different sequence (what they refer to as order-induced error), the researcher cannot be certain whether saturation would have been achieved within 8–17 interviews. Constantinou et al. offered an alternative method to achieve saturation which involves reordering the interviews multiple times. While Constantinou et al. provide a solution for the order-induced error, what continues to be unclear is as follows: How many participants are enough? It is reasonable to assume that the larger the sample size, the greater the number of topics and themes that will emerge. Hence, the issue about whether the sample size and selection are an accurate representation is not resolved with saturation, irrespective of the methods proposed. Based on the proposed methods for saturation and the literature critiquing these processes, it would appear saturation does not, *de facto*, contribute to the credibility or trustworthiness of qualitative research. In agreement with Wray, Markovic, and Manderson (2007), in reality, no data are ever truly saturated.

An alternative to thematic (or data) saturation is a statistical calculation for sample size proposed by Fugard and Potts (2015). While debates have been ongoing about the use of a statistical calculation for sample size in qualitative research, this may be a useful way for ODDE small data researchers to consider sample size within the context of the study before the data have been collected (*a priori*) rather than after the data have been collected (*a posteriori*). As noted previously, saturation is determined based on data analysis redundancy or cessation of new theoretical insights. As such, sample size is determined *a posteriori*. Fugard and Potts have proposed sample size can be determined *a priori* based on the contexts, similar to determining sample size in mid-sized quantitative research, such as survey methodology. Fugard and Potts proposed that sample sizes are comparable to those found in the literature, for example, “. . . to have 80% power to detect two instances of a theme with 10% prevalence, 29 participants are required. Increasing power, increasing the number of instances or decreasing prevalence increases the sample size needed” (p. 669).

Fugard and Potts (2015) acknowledge that the statistical calculation they have developed (and is open access; see Appendix) is not sufficient, in and of itself, for qualitative research. Rather, it is to be used in combination with other contextual considerations. As such, the statistical calculation proposed and developed by Fugard and Potts can be used as a practical tool for ODDE small data researchers to plan sample size involving thematic analysis, *a priori*. The tool is easy to use; the

calculations are provided so qualitative researchers who are unfamiliar with statistical calculations should not have problems determining a sample size.

To be clear, Fugard and Potts (2015) do not propose that their tool will provide thematic saturation; rather, it is to be used as a useful estimate when planning for a qualitative research project (e.g., funding and ethics). Given the issues with determining saturation, using Fugard and Pott's statistical calculation is a viable tool worth considering in ODDE research. As Fugard and Potts note, it should be used with consideration of the context, and while not stated by Fugard and Potts, it could also be used alongside a saturation method, whereby sample size is estimated a priori and saturation is conducted a posteriori.

---

## **In Consideration of Big and Little Science for ODDE**

Up to this point, big data and little data have been presented as separate forms of research. However, as discussed, both have possibilities and problems with respect to the kinds of insights obtained. Given the vast range of topics and practices in ODDE, ODDE researchers are well-positioned to generate meaningful research questions that can be effectively answered using both big and little datasets. ODDE researchers can use the analysis of big data patterns to gain information on what is occurring, which can be used in tandem with qualitative methods to gain better insights on why. Big data analytics, for example, can provide essential information about what ODDE students do online, where their activities are located, and what courses they are enrolling in, but it cannot explain why ODDE students leave their programs of study or why they select certain educational institutions, nor understand ODDE students' opinions and thoughts about their educational experiences. Qualitative research can gather data that provide insights into ODDE that shape how researchers can gain further understandings of ODDE. For example, if the ODDE researcher is interested in back channel text-based communication in asynchronous MOOC courses, discourse analysis (a method for studying written language in relation to its social context) would likely be the research method chosen. The analysis of discourse in a MOOC course would be difficult and time-consuming to conduct and would require substantive resources and a large research team. However, data visualization tools could be used to establish patterns and relationships, which could then be followed up with ethnographic observations and interviews to make the links with big data patterns and in-depth data from individual students or cases. Another example could be collecting big data from social network analysis (SNA) to build on distance learning theories. In particular, SNA could determine the relationships between the actors that facilitate the flow of information. Based on the relationships generated by SNA, ODDE researchers could follow up with ethnographic observations of the textual communication in distance education courses for richer understandings of relationships. As Mills (2018) notes, small datasets that use qualitative methods are useful for refining (and/or generating) theories that are used by researchers to explain the data. This is important in that what data are collected will always have "an element of arbitrariness, and data are

not truth in themselves. They are simply sources of evidence that can be used to assert a certain view of reality” (Mills, 2018, p. 599). Mills also notes that the data researchers collect belongs to the subjects and are constructed in situ and must be collected accordingly.

---

## Conclusion

This chapter provides a discussion on the possibilities and problems of little science and big science. An often-overlooked aspect by new and experienced ODDE researchers is to acknowledge we do not have shared understandings of what big data and little data are. An important aspect presented in this chapter is that when conducting research in ODDE with big and/or little data, ODDE researchers need to provide working definitions. This chapter also highlighted some of the limitations of the use of big and little datasets; however, it is certainly not an exhaustive description of all the problems and limitations. ODDE researchers who enter into research projects who are aware of the limitations are best prepared to provide either alternatives or additional research practices to compensate for the limitations, as well as to clearly and fully explain the limitations providing readers with a full understanding of the trustworthiness of the findings. All research is flawed.

Finally, the possibilities of gaining insights about ODDE through the building on and/or blending of big and little datasets are limited only by our imagination. Through the use of big and little datasets, we can gain further information and meaningful insights about persistent problems in ODDE, such as the following: Why is attrition so high in self-directed/self-regulated distance education? What distance education theories provide the greatest explanatory power for at-risk ODDE students? Are there specific characteristics of students at risk? And if so, are there strategies that can assist at-risk students? What are the characteristics of successful distance education students? What kinds of communication platforms provide the best support for ease of group communication for ODDE students? What kinds of online learning activities are effective at supporting critical, creative, and complex skills? Is a blended asynchronous and synchronous communication format more effective than a non-blended format for ODDE? Do student characteristics impact the kinds of communication effectiveness? In what ways do discipline impact communication effectiveness?

When big and little datasets are used to investigate ODDE, we have the ability to gain information about what our open and distance education students are doing and why they are doing what they are doing.

## Appendix

### *Big data open access tools*

There are few options for ODDE researchers who wish to use open access software for big data collection and analysis. However, there are several tools that offer free use and/or free trial options. The three most commonly used tools providing these options are:

Domo (domo.com)  
Grow (grow.com)  
Toucan Toco Data (toucantoco.com)

### *Little data open source tools*

Computing the sample size proposed by Fugard and Potts (2015) is provided in the appendix of their paper (pp. 483–484). The following is the example provided by Fugard and Potts:

To compute the sample size required for a power of 80% to find a theme prevalence of 0.1, and 2 instances, run:

```
sampSizeForQual(0.8, 0.1, 2)
```

This gives the answer 29.

Fugard and Potts also note that this code may be run even if R is not installed. Two sites that are open access for qualitative researchers wishing to determine sample size a priori are:

R-Fiddle (r-fiddle.org)  
Ideone (ideone.com/oT4BRE)

Both are open access.

## Abstract

This introductory chapter delves into global perspectives and internationalization surrounding around the field of ODDE by distinguishing and exploring the concepts of global perspectives *on* ODDE and the globalization and internationalization *within* ODDE. This introduction outlines the setup of the section, connects the individual chapters, and develops the section per content areas covered. Following this portrayal, implications for ODDE theory, practice, and research in global perspective are then drawn from the contributions in this section. In sum, the chapters call for continuous engagement of researchers and

practitioners in the field to facilitate a broad and multifaceted scientific discussion on the practice of ODDE that is mindful of the entanglement of culture, voice, policy, and economics in a global view.

---

### Keywords

ODDE · Global perspectives · Internationalization

---

## Background

Under the term of Open, Distance, and Digital Education (ODDE), several concepts are subsumed that on first sight easily align with ideas of internationalization and global perspectives in education as the term seems to hint at overcoming temporal, spatial, and even institutional boundaries. However, the entanglement of ODDE with internationalization and global perspectives is more complex and even partially contradictory (e.g., Gunawardena, 2014).

In his study on research areas in distance education, Zawacki-Richter (2009) identified “Globalization of education and cross-cultural aspects” (p. 7) to be a neglected research area at the macrolevel of distance education systems and theories. Globalization is delineated to encompass “[a]spects that refer to the global external environment and drivers, the development of the global distance education market, teaching and learning in mediated global environments and its implications for professional development” (p. 7). As indicated in the labeling of this research area and its description, focal points are aspects related to culture at different levels as well as globalization in education as opposed to internationalization (Altbach & Knight, 2007). However, during the years that have followed this systematization, linkages between globalization and culture and others – such as access, equity, ethics, and educational technology (Zawacki-Richter, 2009) – have become more apparent and pressing (e.g., Tait & O’Rourke, 2014).

To connect with the overarching topic of this section of the handbook, the main distinction to be drawn is between the global perspective *on* ODDE and the globalization and internationalization *within* ODDE. While the majority of the chapters in this section can be read in pursuit of offering or contributing to a global perspective *on* ODDE (e.g., ► Chaps. 16, “Assessing the Digital Transformation of Education Systems,” ► 17, “The Impact of International Organizations on the Field of Open, Distance, and Digital Education,” ► 18, “Online Infrastructures for Open Educational Resources,” and ► 20, “Challenges and Opportunities for Open, Distance, and Digital Education in the Global South,” by Qayyum, Orr, Mays, Marin and Villar-Onrubia), several chapters also emphasize processes *within* ODDE (e.g., ► Chaps. 25, “International Partnerships and Curriculum Design,” by Reiffenrath and Thielsch, and ► 24, “International Students in Open, Distance, and Digital Higher Education,” by Mittelmeier). In the following, these two differing views are considered and substantiated with examples to illustrate how they have played out in research and practice so far.

## Global Perspectives on ODDE

In this section, global perspectives *on* ODDE is understood to be more encompassing than a national, regional, or merely institutional view and serves to sketch out the broader picture of ODDE as it unfolds across the globe. The perspective *on* ODDE aims to provide an overarching view by following the idea of cultural clusters across the globe (Ronen & Shenkar, 2013), comparisons of ODDE systems in an international perspective (Qayyum & Zawacki-Richter, 2018; Zawacki-Richter & Qayyum, 2019), and the focus on groups of countries (Latchem, 2018).

(Economic) globalization “involves a stretching of social relations across time and space such that day-to-day activities are increasingly influenced by events happening on the other side of the globe and the practices and decisions of highly localized groups and institutions can have significant global reverberations” (Goldblatt, Held, McGrew & Perraton, 1997, p. 271). In recognition of this entanglement on various levels, the United Nation’s Sustainable Development Goals (SDGs) argue that a *global* effort is needed to “achieve a better and more sustainable future for all” (United Nations, n.d.). This conclusion also applies to the broader field of education. The Covid-19 pandemic and its effects on education around the globe (Bond, 2020; Bond, Bedenlier, Marín, & Händel, 2021; Marinoni, van’t Land & Jensen, 2020) serve as one example of how education systems across the world have suddenly faced similar challenges and now need to adapt to changing realities. For ODDE, this global entails viewing developments in a comparative manner (e.g., Qayyum & Zawacki-Richter, 2018) to frame perspectives and conceptualize the broader landscape in research and practice.

---

## Globalization and Internationalization *Within* ODDE

Globalization and internationalization *within* ODDE relates to developments that contribute to an internationalized or globalized stance within ODDE. Drawing on an established definition in the realm of higher education, internationalization “is defined as the process of integrating an international, intercultural, or global dimension into the purpose, functions or delivery of postsecondary education” (Knight, 2003, p. 2). In contrast, globalization is understood “as the economic, political, and societal forces pushing 21st century higher education toward greater international involvement” (Altbach & Knight, 2007, p. 290). Jointly, they relate to questions of culture (Gunawardena, 2014), the nature of globalization as a primarily economically driven meta-process (Carnoy & Castells, 2001), and the intersections of internationalization and globalization within education (see e.g., Altbach & Knight, 2007, for higher education).

A central topic permeating developments within ODDE has been that of culture (e.g., Al-Harthi, 2006) and specifically the role of hegemony of pedagogical values and theories in educational technology (e.g., McLoughlin, 2001; Lauzon, 1999). Tait and O’Rourke (2014) sum up the problem: “Transplanting any technology along with its ideological roots brings the risk of imposing an inappropriate set of assumptions and values on the users, thus detracting from, rather than supporting, intended goals” (p. 45).

However, approaches to navigating this situation have been scarce so far. These questions and challenges for research and practice constitute one aspect located within the broader realm of internationalization and globalization within ODDE, and another is rooted in the institutional structures that characterize open (higher) education.

From an institutional focus, open education, as exemplified via the plethora of open universities that were founded in the twentieth century in numerous countries (Zawacki-Richter, von Prümmer & Stöter, 2015), has operated so far with a focus on the national education context (Tait, 2018). This is reflected in the institutions' names, such as Open University of China, Indira Gandhi National Open University (IGNOU), or University of South Africa (UNISA). While open universities, such as the Turkish Anadolu University, also make efforts to internationalize through branch offices in other countries (Kondakci, Bedenlier, & Aydin, 2019), they continue to cater mainly to a nationally spread student body. This focus is also partly due to the language of the respective study programs. With open universities operating mainly at a distance, the uptake of increasingly digital formats in teaching, learning, and administration has led, in principle, to an even easier and faster dissemination of learning materials, accessibility of instructors and institutional information, and potentially easing the way to a global orientation. However, established notions of internationalization within higher education (Knight, 1994), or globalization (Altbach & Knight, 2007), largely work from the perspective of brick and mortar education institutions. Only recently have concepts such as virtual internationalization (Bruhn-Zass, 2020) or internationalization at a distance (Mittelmeier, Rienties, Rogaten, Gunter, & Raghuram, 2019) emerged that focus on the interplay of different institutional structures and the role of ODDE therein. Despite earlier arguments in favor of internationalized ODDE (Msweli, 2012), only recently has research engaged in this area and the specific topics therein, for example, the use of Open Educational Resources to foster internationalization (Nascimbeni, Burgos, Spina, & Simonette, 2021) or skills of learners in open virtual mobility contexts (Rajagopal et al., 2020).

---

## Structure of the Section

This section collates a comparatively broad array of chapters that each addresses specific aspects of the global perspective *on* and international dimension *within* ODDE. While the section largely revolves around the macrolevel of distance education systems and theories (Zawacki-Richter, 2009), it also includes several chapters that align with the mesolevel of the institutions and the microlevel of teaching and learning within ODDE. As readers delve into the different chapters, it is suggested they do so with the idea that each chapter can be compared to a mosaic stone – showing the different facets of global and international perspectives and forming a whole when pieced together.

The section begins with Adnan Qayyum's comparative assessment of the digital transformation of education systems, as it unfolds around the variables of digital assets, digital use, digital labor, and digital outcomes that are specific to each country and its education system. The author also stresses that the pandemic lays open shortcomings

associated with these variables; for example, the lack of preparation of educators for completely remote education. Following this assessment, Dominic Orr delineates the role that international organizations such as UNESCO and OECD play as proponents of ODDE via the concepts of ideation, digital infrastructure projects, and multistakeholder networks. Another common thread of the chapter is the interrelatedness of international organizations and ODDE institutions in mediating expertise in the endeavor to develop accessible learning opportunities for all. Access to (informal) learning opportunities cannot be realized without infrastructure. Thus, Victoria Marín and Daniel Villar-Onrubia focus on infrastructures that enable the sharing of digital pedagogical resources – on a global and cross-border scale as well as national and regional. They illustrate the existing plethora and diversity of platforms, repositories, and initiatives while also highlighting associated challenges pertaining to quality assurance, sustainability, and the dominance of the Global North. In the following chapter, Sanjaya Mishra and Pradeep K. Misra view ODDE through the lens of nonformal education in developing countries and stress that ODDE can and does serve as an important means to foster educational opportunities in addition to formal education. However, they also call for locally anchored research into this nexus and highlight the need for attention in educational policy making. On the other side of the spectrum, Jill Borgos, Kevin Kinser, and Lindsey Kline focus on the borderless market that has revolved around ODDE, stressing the value that this educational segment has for public and private stakeholders and shedding light on intertwined issues such as privatization of education and questions of privacy and security.

The following chapters revolve around the specific education segment of higher education, shedding light on the fact that traditional internationalization within higher education and ODDE find increasingly common ground in their concepts and practices. Readers are nevertheless also encouraged to consider crucial aspects of these chapters in relation to other formal education settings. Elisa Bruhn-Zass elaborates on the concept of virtual internationalization as a new layer that can potentially permeate all dimensions of the comprehensive internationalization that brick and mortar higher education institutions (HEIs) strive to achieve. In this context, forms of ODDE are perceived as a means to realize different and new forms of HE internationalization. Correspondingly, the chapter by Tanja Reiffenrath and Angelika Thielsch focuses on the ways in which higher education institutions can foster their partnerships in international digital teaching and learning settings. They emphasize the importance of curriculum design as the “backbone” (Reiffenrath & Thielsch, 2022, p. 6) for international online courses, while also highlighting the role of virtual mobility and virtual exchange for current policy developments within the European Higher Education Area. Revisiting established notions of internationalization – and more specifically of international students – is also the focus of the contribution by Jenna Mittelmeier. She stresses that previously held assumptions about this group require reconsideration in the context of ODDE, including questions as to how define international students in ODDE, understand their specific experiences, and establish a broader knowledge base to inform further research and practice. Amir Hedayati-Mehdiabadi and Charlotte N. Gunawardena’s chapter on ethics and culture concludes this subsection by aligning course design for heterogenous learners in higher and adult education. They delineate

the topics of community and language as crucial for the design of inclusive learning environments in ODDE and emphasize the role of the educator shaping the learning environment.

ODDE and its affordances to flexibly overcome time and space may lead to a global perspective that takes an equalizing stance. However, several of the chapters in this section critique such a perspective by voicing the need for specific consideration and focus. The remaining chapters in this section make this explicit and target topics that argue for a “global” and “international” perspective that is mindful of both the obvious differences between regions and countries and the subtle differences regarding voice and distribution of power in a seemingly all-accessible context. Tony Mays lays out the context of ODDE in the Global South and points to the fact that despite the perceived education potential of ODDE and existing projects and initiatives, challenges such as technical infrastructures continue to impede expanded implementation of ODDE. These and other aspects are mirrored in the contribution by Laura Czerniewicz and Lucila Carvalho, who discuss issues of equity within a global perspective of ODDE. Their chapter directs the reader to consider the intertwining dimensions relating to equity and ODDE, such as datafication, the precondition of an unequal postdigital society, and the effects on individuals and societies at large. The final chapter in this section resonates with the idea of stepping back to discern the different discourses revolving around ODDE in a global perspective. Jean-Paul Restoule and Kathy Snow focus on the situation of Indigenous ODDE students in Canadian higher education. Taking a personal stance, they argue that attention to the individual and social environment of a learner or group of learners remains crucial in order to see and address their needs appropriately and allowing for a broader range of voices in the discourse on ODDE.

---

## **Conclusions and Implications for Theory, Practice, and Research**

The chapters in this section illustrate the array of topics that can be considered mosaic pieces under the heading of global perspectives and internationalization in ODDE. In sum, they provide a picture of a field that is still in the process of becoming – leaving ample space for further engagement in theory, practice, and research. As it stands, these three fields are not to be seen as separate grounds but rather interwoven and mutually dependent.

---

## **Theory**

### **Revisiting Theory**

Given the dispersed nature of the chapters, the wish for simply “more” theory would be short-sighted as the state of theoretical advancements is potentially rooted in different disciplines and should be considered individually for each topic. What can

be concluded from some chapters – for example, Bruhn-Zass, Mittelmeier, Restoule and Snow, Czerniewicz and Carvalho, and Hedayati-Mehdiabadi and Gunawardena – is that existing assumptions and theoretical concepts are not sufficient to account for the entanglement of global perspectives and ODDE. Rather, as the authors of these chapters show, existing concepts leave room to be developed further and conceptualized into more encompassing concepts. This task also includes challenging existing understandings, for example, of what constitutes an international student, or disentangle facets of equity to understand how it relates to current changes in society and education. Furthermore, the revisiting of existing concepts and theories also necessitates asking: whose voice is being heard in the creation and dissemination of theory, which aligns closely with questions relating to the conduct and dissemination of research.

---

## Practice

### Reconciliation of Stakeholder Perspectives

The practice of ODDE in relation to global perspectives and internationalization is complex: A plethora of stakeholders with diverging and partly opposing intentions (e.g., international organizations, (education) enterprises, public and private education institutions, platform providers as well as individual instructors and learners) need to be cognizant of, and even reconcile, their interests and do so in a cross-border manner. Thus, despite the focus being primarily located on the macrolevel, the content of these chapters ultimately affects the level of individual courses and learners' experience in ODDE, as well as their personal life situation beyond ODDE. It seems therefore advisable for any practitioner involved in ODDE to consider these intersections and (diverging) interests, especially on the continuum of the ideas of “open” on the one hand and the global market perspective on the other (see ► [Chap. 22, “The Borderless Market for Open, Distance, and Digital Education,”](#) by Borgos, Kinser, and Kline).

### Questioning Educational and Technological Hegemony

Several chapters in this section also highlight the fact that specific cultural values are inscribed into educational technology and current practices and views on pedagogies. Therefore, ODDE cannot afford to take a “one size fits all” approach if it is to be applied and put to use in favor of cultural plurality, specific geographic and institutional preconditions, and be true to its often proclaimed character as an enabler for the provision of education *for all*. Again, while the chapters in this section emphasize on several levels, enacting this in and through practice remains an issue to tackle proactively in ODDE.

---

## Research

### Interdisciplinarity

The collection of chapters in this section is not confined to mere pedagogical considerations and research, but rather assumes an interdisciplinary stance, by also drawing on sociology, economics and business, cultural studies, and political science. Such an interdisciplinary stance is important when globalization is considered as an economically driven phenomenon (Carnoy & Castells, 2001). To disentangle the different disciplinary lenses that can be used to scrutinize the global perspective on and within ODDE, it seems advisable to be mindful of the interdependencies that exist between them – and put them to use for holistic research into specific topics.

### Comprehensive Data

While researchers on this topic operate with concepts such as culture, values, or hegemony that are comparatively difficult to grasp and reflect upon (Olaniran & Agnello, 2008), there exists a perceived need to substantiate any research into these dimensions with data to go beyond theoretical and conceptual discussion. The likewise perceived lack of comprehensive and accessible data (e.g., on international distance education students or virtual exchange activities) makes it currently difficult to advance specific subfields empirically. Generating data of this scale seems almost impossible on an individual level, suggesting that international organizations, associations, and entities would need to play an important role in enabling research that goes beyond case studies and small-scale qualitative inquiry.

### Locally Bound Research

Mishra and Misra's suggestion to conduct research through actively involving local communities and Restoule and Snow's anecdotal evidence show the importance of how, and by whom, research is conducted, specifically when questions of culture, local and regional feasibility, and impact are concerned. Going beyond simply conducting research, this perspective also implies an opportunity to revisit publication outlets for research on ODDE – a large majority of which operate in the English language and are hosted in Anglo-Saxon countries. Linguistic plurality and recognition of Non-English language discourse also play into this discussion (e.g., Beigel, 2021).

## Abstract

The digital transformation of education has been underway for decades at differing paces across the world. In this chapter, an education digitization index is proposed in order to assess the extent of digital transformation in various countries. The education digitization index is composed for four variables: digital assets, digital use, digital labor, and digital outcomes. While a lot of research and practice in education has been on digital use – applying particular digital educational technologies – countries with substantial digital assets and a commitment to digital labor are able to transform education systems more readily. Digital assets and digital labor have become more important during the pandemic.

**Introduction**

Digital transformation is the degree to which digital technologies are being used within educational systems. All education consists of groups of people, organizations, and processes configured to help individuals learn in an organized setting. Digital transformation is the extent to which digital technologies are used by people and organizations in the processes and goals of learning in an organized setting. Common examples of digital transformation include institutions offering courses partly or fully online, digital open educational resources (OER), students or teachers using digital platforms to collaborate, and curriculum designed to foster digital skills and competencies as learning goals.

There are several key issues about the digital transformation of education systems including:

- What is the digital transformation?
- How can the extent of digital transformation be assessed?
- How extensive is digital transformation of education systems in various countries?
- How has the pandemic affected digital transformation?

This chapter focuses on what digital transformation is and how education systems in various countries are. The countries discussed have seen documented substantial recent changes in their educational systems (Qayyum & Zawacki-Richter, 2018). An educational digitization index is proposed to assess and compare the extent of digital transformation in countries, an index that can also be used to assess countries' digital readiness for emergency situations like pandemics or climate threats. In doing so, major research will be reviewed on the topic of digital transformation of education systems. The references in this chapter highlight important research about digitization of education in numerous countries, beyond the important comparative work done by international organizations like the Commonwealth of Learning, the Organization for Economic Cooperation and Development (OECD), the World Bank, and UNESCO.

---

**Education Systems**

From an educational systems perspective, inputs and processes combine to create educational and social outcomes. Inputs in education are financial resources (e.g., public and private funding), physical resources (e.g., buildings, infrastructure,

materials), and human resources (e.g., teachers, administrators). Inputs also include education policy and legislation required to allow educational processes to occur (OECD, 2019). Processes are the activities (e.g., teaching, design, learning) and institutions (e.g., school boards, schools, and classes) that are commonly associated with education. Outcomes include the educational goals for learners (e.g., skills and competencies of individuals) and economic and social goals for society (e.g., developing human capital, fostering citizenship, social sorting).

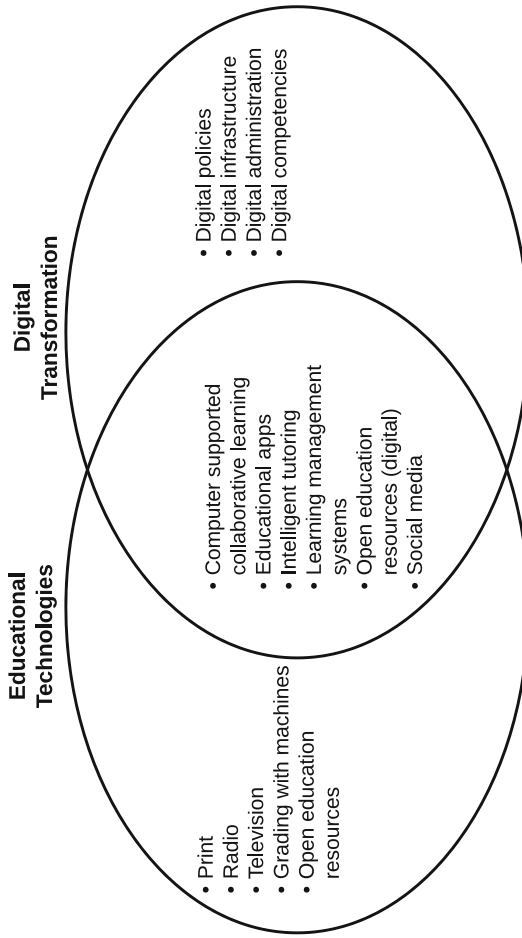

Formal education dominates the education system in all countries, and, indeed, is often synonymous with the term education system in many countries. Formal education in all countries requires or offer participation and progression through structured learning environments at the primary, secondary, and tertiary levels. Countries also have nonformal education – education which is not necessarily for accreditation and is often short term. Nonformal education is sometimes articulated with formal education. In countries like Indonesia and Turkey, it is relatively easy to transfer from nonformal education to formal education. In Indonesia recognition of prior learning is well-established within the education system (OECD, 2020). Turkey has long recognized and supported nonformal education alongside the formal system (Kondakci, Bedenlier, & Aydin, 2019, p. 106).

Formal education differs among countries in the starting and ending age of compulsory education, number of years for primary and secondary education, routes for progress through formal education, recognized exit points, options for vocational and higher education, and types of certification (OECD, 2020). Countries also differ in the amount of government regulation and active involvement in education, the extent of public and private education provision, and options for access and participation in education. Participation is at least partly affected by financial, administrative, and physical barriers to education. At the primary, secondary, and tertiary levels of formal education, the classroom is the most common type of physical setting, but this can vary in countries from a room with walls to an outdoor space under a tree. Digital technologies can challenge the physical access barriers to education participation, financial costs, policies, public and private provision, the relationship between formal and nonformal education, as well as pedagogy, teaching, design, and quality.

---

## Digital Transformation

The digital transformation of education systems is not the same as the growing use of educational technologies. Educational technologies have been around for over a century, since before Edison's use of film in classrooms. Print, radio, and television are technologies used for education that predate the first digital technologies (see Fig. 1). In India some of these are referred to as on-air, as opposed to online, educational technologies (India Ministry of Human Resource Development, 2020, p. 6). During the pandemic, on-air technologies have become crucial to deliver educational content in many countries that sought to ensure “no learners were left behind” (Bozkurt et al., 2020, p. 10).

**Fig. 1** Examples of educational technologies and digital transformation

Certainly, educational technologies are a part of digital transformation of education systems. These are important tools for teachers, designers, and learners. However, the digital transformation of education systems is broader than educational technologies because education systems are about more than teaching and learning processes. Educational technologies are an important but not exhaustive part of the digital transformation of education systems. Digital transformation involves both digital educational technologies and non-technology initiatives.

Inputs and outcomes, as well as processes, are part of the digital transformation of education systems: inputs include policies and physical and human resources; processes include recruitment, providing access and flexibility to students, and retention, as well as all curriculum, teaching, and learning with digital interaction and content; outcomes include providing learners with digital skills and competencies. For examining digital transformation, these other dimensions of education systems are important. Not including these dimensions can substantially limit digital use that occurs in the “classroom” for teaching, learning, assessment, and other core functions of education.

Another useful way to think about the dimensions of the digital transformation is categories developed by Baker and Smith (2019) for the field of artificial intelligence for education: learner-facing, teacher-facing, and system-facing perspectives. In artificial intelligence for education, learner-facing perspectives focus on tools that students use: to receive information, content, and feedback, to collaborate with students, and to improve their learning. Teacher-facing tools help teachers “to reduce their workload, gain insights about students and innovate in their classroom” (Baker & Smith, 2019, p. 12). This can include insights about student progress, organizing students, methods of teaching, and automating assessment, feedback, and administration. System-facing tools often require sharing data to administrators, managers, and policymakers for insights about enrollment, progression, retention, and attrition (e.g., via learning analytics). Identifying system-facing tools, policies, and initiatives requires acknowledging a broader perspective for assessing digitization beyond digital educational technologies.

---

## Education Digitization Index

Digital transformation is a topic of importance not just for education systems but also for nearly every sector of society. In fields like health care, government, and business organizations, there is ongoing research and discussion about the extent to which digitization has been and should be undertaken. These fields have developed ways to measure the extent of digital transformation. Gandhi, Khanna, and Ramaswamy (2016) created a digitization index of 27 indicators organized into three groups: digital assets, digital usage, and digital labor. Digital assets refer to physical resources and infrastructure like computers, mobile devices, networks, software, and IT services. Digital usage is how much digital engagement there is in processes such as transactions, interactions, organizational dynamics, and outreach (e.g., marketing using social media). Digital labor measures how digitized work is,

including how many jobs are digital occupations, and how much is spent supporting workers' digital skills and capacity.

A digitization index can be helpful for assessing and comparing the extent of digital transformation in various countries. However, for the field of education, some of the digitization indices used in other sectors are useful and some are not. Digital assets are certainly crucial. Digitization is not plausible or perhaps even desirable if there are more accessible and viable non-digital options for education systems. Digitization can be costly both for initial and ongoing investment of money and people. In many countries, digitization initiatives redirect efforts and resources from more accessible and affordable options for creating structured learning, so digital asset is a necessary but not sufficient major index for analyzing the extent of digital transformation.

Digital labor is certainly relevant to education. For example, while the field of instructional design existed before digitization, it has emerged as a mainstream educational occupation in many countries in the past 25 years. Instructional design (or learning design) is digital labor that is necessary for digitization in education. There is an unfortunate and long history in the field of education where the use of educational technology has been encouraged and undertaken without recognizing the importance of training and support of educators. Cuban is perhaps most renowned researcher about how teachers have not always accepted the use of machines for teaching (Cuban, 1986), and digital technologies are oversold and underused because of the lack of support and buy-in by educators (Cuban, 2001). Educational technologies often do not gain traction because there is not enough teacher-facing support for education workers to become digital workers who can develop their knowledge, skills, and capacity to use these technologies.

Digital use is heavily researched in education. The use of digital tools for education, especially for teaching and learning in western countries, is well-enumerated and forecasted. (See websites about the most used digital technologies for learning such as [www.toptools4learning.com](http://www.toptools4learning.com) and Educause's *Horizon Report* of tech trends.) Digital use of learner-facing technologies has been extensively researched. (For example, Tamim, Bernard, Borokhovski, Abrami, and Schmid (2011) have written a second order meta-analysis of all the meta-analyses about the effectiveness of using learning technologies.) There is an immense amount of research about the effectiveness of digital technology A used in educational setting B to achieve learning outcome C. However, even here, much of this digital use research about learning effectiveness is not connected to assessments about digital assets, digital labor, and digital outcomes. In the language of evaluation, the research is about the merits of digital use but not the worth.

Finally, the digitization index for other sectors misses an important category which is perhaps unique to education: outcomes. Education is not as transactional as many other sorts of services or products in society. All formal and much of nonformal education involves middle to long-term relationships among participants (e.g., teachers and learners; learners with each other) in order to foster the learning and economic goals of education (e.g., knowledge, skills, citizenship, human capital). Introducing digitization into educational relationships and processes can change

the learning, economic, and social goals of education. The outcomes and goals of education usually fall into three categories, sometimes called the iron triangle: access, quality, and cost (Porto, 2013). While digitization can be interesting to try, it must eventually have some larger purpose if it is to move beyond experimentation toward efforts to change education systems. Does digitization help change access and participation barriers? Does it increase the quality of learning and teaching, by improving or changing the learning experience or outcomes in positive and meaningful ways? Is digitization worth the usually heavy cost investment, especially compared to other sorts of ways to support and improve education systems? If digitization does not address one or more of these three sets of goals, then the merit and worth of digital initiatives will rightly be questioned.

A more useful set of digitization indices in education should account for the unique outcomes, as well as the inputs and processes of education systems. Based on existing work, the following indices can be useful for assessing the extent of digital transformation in education systems: digital assets and infrastructure, digital labor, digital use, and digital outcomes. To fairly compare countries with some rigor, there needs to be a point of reference or common denominator. Raivola (1985, p. 363) calls this point of reference a *tertium comparationis* or third comparison. The education digitization index can serve as the *tertium comparationis* to compare countries with common variables.

---

## Digital Transformation in Education Systems

### Digital Assets and Infrastructure

Certainly, Altbach, Reisberg, and Rumbley (2009) were correct that, to varying degrees, all countries are encountering digitization. Countries differ in how much of their education system (i.e., inputs, processes, outcomes) has encountered digitization. Digital assets are recurrently the biggest concern in many countries. Limited digital assets and infrastructure is an access barrier that precludes digitization outside of developed and developing countries with established or emerging digital policies and infrastructure. The International Telecommunications Union profiles over 180 countries for access and use of computers and mobile phones, broadband availability, bandwidth use, and Internet use. Globally, over 55% of households have Internet access at home (ITU, 2021a, p. 13). In developed countries, 80% of people are online, while in developing countries, 45% of people use the Internet. However, in the 47 Least Developed Countries, “four out of five individuals (80%) are not yet using the Internet” (ITU, 2018, p. 2).

None of the UN-classified 47 Least Developed Countries have the physical digital infrastructure for substantial digital transformation of their education systems. Certainly, there are important individual digital initiatives in less developed countries. For example, the African Virtual University has been operating for over 20 years, initially as a World Bank project and now as an intergovernmental organization involving 15 African countries. Nafukho and Machuma (2013) claim that the

e-learning activity from the African Virtual University has led to a growth of interest in e-learning and even growth in telecommunications infrastructure in sub-Saharan Africa. In other words, educational digital use has helped expand digital assets. It has also led to increased interest in digital initiatives among less developed countries like Uganda, for example, which recently saw the launch of Royal Open University, a fully online institution. There are also digital initiatives in and for less developed countries by educational institutions, governments, businesses, and international development organizations. (See, for example, the Commonwealth of Learning's video on demand MOOCs for low bandwidth regions, including less developed countries, [www.col.org/news-type/mooc/](http://www.col.org/news-type/mooc/).) While there are a lot of digitization initiatives, they are not the necessary digital assets and infrastructure for substantive digital transformation of education systems in most Least Developed Countries. In these countries, there tends to be more focus on non-digital initiatives often using analog and on-air technologies. Unfortunately, then, most discussions about digital transformation of education systems are conversations about developing and developed countries. Before the pandemic, discussions on digital transformation of education systems in Least Developed Countries were likely imprudent and impractical.

For purposes of brevity and sampling, comparisons will focus on a handful of developed and developing countries. Most developed countries have the necessary physical digital infrastructure for transformative educational digitization. There is substantial Internet access in countries like the United Kingdom (92.9% of households), Germany (90.8%) (ITU, 2021c, p. 9), and Canada (89%) (ITU, 2021a, p. 15). However, even in some of these countries, there is an important rural-urban access divide (ITU, 2021a, p. 1). So, nearly all developed countries have formal policies and funding at the national or regional levels for digital infrastructure initiatives. These are usually not initiatives solely for education but for digital connectivity more broadly.

A forward-looking example for digital assets is South Korea. Nearly all households (99.7%) have access to the Internet, and nearly all people there (96.2%) were regularly using it as of 2020 (ITU, 2021b, p. 18). South Korea has extensive physical digital infrastructure based on a combination of government policies and a strong telecommunications sector. Government policies like Cyber Korea in 1999, e-Korea in 2002, u-Korea in 2005, and a "Master Plan in Preparation for the Intelligent Information Society" more recently (Korea MSIP, 2016) have promoted strong links between government, businesses, and research communities to foster a sophisticated and responsive digital infrastructure. The government has initiated several systems-facing policies that have created assets needed for transformation of the education system. At the tertiary level, the Korean National Open University has been operating since 1972 as an open and distance education institution. A national education TV channel, EBS – Education Broadcasting System – was launched in 1980 to promote lifelong learning for adults but also to supplement school education (Jung, 2019, p. 101). The South Korean government also allowed for private institutions to be certified to provide e-learning when online classes began to emerge in the 2000s (Lim, Lee, & Choi, 2019, p. 93). At the same time, the government established plans

to support campus-based universities to offer distance and blended learning. Digital and educational policies and funding created strong digital assets and infrastructure in South Korea.

In developing countries (UN DESA, 2020, p. 166), household Internet access ranges from a high of 88.3% in Turkey to 67% for Brazil and around 60% for South Africa and China to 23.8% in India (ITU, 2021b). Importantly, in developed and especially developing countries, there is far more Internet access via mobile phones than computers. This is revealed in data showing more people use the Internet than have access at home (e.g., Brazil has 70% Internet use with 67% Internet access at home (ITU, 2021a, p. 15).

Digital assets include policies that recognize there is no universal digital access and use. For example, the Chinese Ministry of Education created policy documents in 2018 like the Education Informatization 2.0 Action Plan (in Yan & Yang, 2021). Informatization refers to the use of all information technologies (Xiao, 2019, p. 516). It includes digital technology initiatives like supporting the “steady development of online distance education” (China Ministry of Education in Yan & Yang, 2021, p. 412). However, informatization can also consist of non-digital technologies like radio for education. Non-digital options are included and continue to be important in the education system such as the development of the broadly defined “information literacy” (Yan & Yang, 2021, p. 420). The need for and use of digital technologies is a subset of the larger initiative of “informatization.” As digital technologies are not universally accessible, there is an acknowledgment of working with current assets, while initiating strategies like “Internet Plus” to expand digital access (Zhang, 2019, p. 24).

## Digital Use

Digitization has permeated all stages of education systems in some countries. This digitization involves technologies and non-technologies outside the “classroom.” In tertiary education in most western countries like Australia or Germany, most functions are deeply digitized beyond teaching and learning, including administration (i.e., marketing and recruitment for universities, registering, enrolling, and managing students, etc.), libraries (i.e., online journals and books), research (i.e., data gathering, storage and analysis, writing and publishing reports and articles), and, of course, communication among students, instructors, administrators, and researchers (Selwyn, 2014).

For teaching and learning, online and hybrid course delivery (including MOOCs), learning management systems, digital OER, e-portfolios, digital badges, web resources for videos and podcasts, digital gaming, personalized learning content via learning analytics, artificial intelligence for auto-grading and personal tutoring, and thousands of educational apps are all digital educational technologies that have grown in the past 25 years since the web became a part of education. It is important to identify which digital technologies are used and how. For example, in India, digital tools used in primary and secondary education included e-books (used in

31 out of 36 states and territories), e-content repositories (30 states), interactive resources online (in 29 states), digital classrooms (live synchronous education broadcast via television) (in 26 states), and e-learning portals (26 states) (India MHRD, 2020, p. 25). In Germany, constant digital connection and use has changed the teaching and learning experience in physical classrooms. University students revealed that during class they used mobile phones to access course learning management systems (78% did this), send emails to teachers (74%), send mail to fellow students (73%), search the Internet during lessons (74%), research exam papers and presentations (69%), and review grades (69%), among many other digital uses. They also disclosed that they use their mobiles during studies to use instant messaging (88%) and take photos (78%) (Zawacki-Richter, 2020, p. 5).

While such digital use data is important and insightful, to assess digital transformation, what matters is not the specific digital tools but the type of digital use. As Xiao points out, digitization can mean using digital technologies in the classroom without necessarily changing access or quality. He contends that China's 5-year plans for digital transformation show "scanty evidence of open, flexible, distributed, and disaggregated learning encouraged in these plans" (Xiao, 2019, p. 515). For substantive digital transformation, why digital technologies are used matters more than the specific digital technologies used. Using social media in ways that may change quality, access, or cost matters more than whether educators in countries are using WeChat or Facebook.

**Online education mainstreams distance education.** Among the most transformative digital uses has been online and hybrid education commonly used to deliver education at the tertiary level. Online education has not been transformative for primary and secondary education, as there is little evidence of substantial enrollments before the pandemic. Historically, distance education, especially the open university movement, had important goals for access to higher education. However, distance education was tolerated as *apart from* mainstream education. With online education, distance education became *a part of* mainstream education. Before the pandemic, in countries like Australia, Brazil, Canada, and the United States, nearly 20% or more students were enrolled in an online course (Qayyum & Zawacki-Richter, 2018, p. 130). Historically, distance education was offered by open universities – often mega universities with massive enrollments – and some campus-based universities, as part of their continuing education and extension divisions. With the advent of online education, many conventional onsite universities started to offer distance education online. The practice continued to grow in developed countries and has increased in developing countries. In 2002, 25 institutions were allowed to offer distance education in Brazil. As online education started to grow by 2012, 150 institutions were given permission to offer online education. By 2016, 331 institutions were allowed to offer distance education online (Litto, 2018, p. 31). Online education was offered by many established mainstream educational institutions, even before the pandemic.

**Parity of online education.** Acceptance of online education by educators and employers has been transformative in many countries. In developed countries, there is usually not less legitimacy to a degree done via distance online. Employers

recognize online education often as much as other educational formats. This has broken barriers of legitimacy that education systems in countries like Spain and the United Kingdom historically had against distance education. However, not all places have accepted online education, particularly in developing countries. In India, education from onsite schools and universities is given more esteem than online education and other forms of distance education (Panda & Garg, 2019, p. 39). In Turkey, most employers still prefer education from residential programs over online programs (Kondakci et al., 2019).

**Nonformal education growth and acceptance.** The growth of online education has also occurred in nonformal education. In particular, the rise of MOOCs has been important for growing and changing educational provision. While many MOOC offerings are by established educational institutions, they are often offered as nonformal education. Nonformal education seems to have more interest from education systems when offered in digital formats like MOOCs and other online education offerings. In Russia the growing use of MOOCs has led to policies that articulate nonformal MOOCs into formal education (Zawacki-Richter, Kulikov, Pülplichhuysen, & Khanolainen, 2019, p. 58). The South Korean government has a goal of creating an “intelligent information society” (MSIP, 2016). Part of this plan is to “have universities grant students credits for K-MOOCs they complete” (p. 51). Nonformal education via K-MOOCs is changing part of the formal education system by harnessing Prior Learning Assessment that has existed for decades. Digitized nonformal education allows for more self-directed learning by learners, partly changing the role of students and institutions in education systems.

**Online education brings new educational providers.** Online education is offered not only by public institutions but by private companies. Brazil in particular stands out for a huge growth in private online education, as nearly 90% of online education enrollments are from companies (Litto, 2018). For example, Anhanguera Educacional owns Cogna Educação (formerly Kroton), the largest education provider in the world. Anhanguera, along with UNOPAR, Estácio, and Universidade Paulista, has nearly 60% of all online enrollments in Brazil. The large number of enrollments from private companies suggests that there is an educational demand and access issue that public education is not addressing. New private online providers have joined the formal education system.

**Learning management systems “platforming” education.** Learning management systems are commonly used both for online and onsite education. The extensive use of learning management systems has created the “platformization” of education, particularly tertiary education. Platformization is the penetration of digital platforms to the point where the practices of a sector become reorganized around the platform (Poell, Nieborg, & van Dijck, 2019, p. 6). Platforms complement or replace teaching at schools and campuses depending on if they are part of onsite, online, or blended education. Whether it is Moodle, Google Classroom, Coursera’s platform, Yuanfudao in China, or DIKSHA in India, platforms as integrated online services for learners or teachers have become the norm in many countries. This did not exist 25 years ago before the growth of the digitization of education.

**Open Educational Resources changing costs and practices.** OER have existed before digital education. However, since digitization OER have had substantial impact in education systems, nearly every developed and developing country has or uses OER. Institutions in Australia, Canada, and the United States have been pioneers in OER and have actively built repositories. Countries like Germany have started to build extensive digital infrastructure to allow for OER use. One of the eight actions in China's Education Informatization 2.0 Action Plan is to build "a national public service system for educational resources" (Yan & Yang, 2021, p. 417). India has a National Repository of Open Educational Resources. In South Korea, the Korea Education Research and Information Service (KERIS) organizes and makes accessible OER. OER have reduced costs for students and learners to use learning materials. They have also changed the discussion about public and private access to knowledge and information to the point where high-profile organizations like the Gates Foundation and the World Bank support OERs at primary, secondary, and tertiary levels of education provision. As many governments decline their investment in education, OER have become more important for education systems.

## Digital Labor

Increasingly in most developed and developing countries, teaching is digital work, both for onsite and online education at primary, secondary, and tertiary levels. However, few countries seem to provide adequate training, development, and support for teachers and faculty. Despite large and varied use of digital technologies for learning, there is still surprisingly little support for teachers and faculty. Most of the focus with digital technology initiatives seems to be on the learner-facing dimension with a huge gap in supporting teachers and faculty.

The lack of pre-service and in-service teacher training for using digital technologies is well-chronicled. Bond, Zawacki-Richter, and Nichols (2019) found that "issues of educator professional development with technology has been a particularly recurring theme across the past five decades, with institutions at all levels struggling to find the resources to release educators, or to implement sufficient preservice teacher education with technology" (Bond et al., 2019, pp. 39–40). It is not just a lack of training. They found "a lack of institutional support to provide the space and time" (Bond et al., 2019, p. 12) for technology integration. A similar concern exists for the tertiary level educators. Bates lamented that in Canada most faculty and instructors are unprepared to teach students using digital technologies and to develop "knowledge and skills for a digital society" (Bates, 2020, p. 60).

Many countries have acknowledged this gap. India has created DIKSHA (Digital Infrastructure for Knowledge Sharing), a digital repository for content and courses targeted at teachers and others. The repository has learning materials from experts, including teaching videos, explanation videos, lesson plans, and experiential learning videos among other resources. Given India's diversity, the resources are

available in over 30 languages and can be used offline. The European Union has created a digital competence framework for educators (DigCompEdu). It allows educators to assess their digital competencies, recognize their knowledge and skills needs, and take appropriate training (Redecker, 2017). These are teacher-facing initiatives that became more important since the pandemic.

## Digital Outcomes

Digital outcomes are educational goals and outputs that also reflect the extent of digitization in an education system. Educational outcomes are digital outcomes when access, quality, or cost are changed or aspired to via the use of digital technologies. Not all educational outcomes are digital outcomes. Improving learning effectiveness is not an outcome specific to digitization. It can be improved in multiple ways unrelated to digitization (e.g., changing pedagogy). Offering large-scale courses are also not a digital outcome. Broadcast-based courses have reached thousands of students at a time for decades. However, it would be a digital outcome – a measure of the extent of digitization – if personalized learning and feedback was being provided system-wide at scale to thousands of MOOC students via digital use (e.g., artificial intelligence and learning analytics) and digital labor (i.e., personnel to develop and administer digital tools). It is a digital outcome when there is a notable increase in digital competencies among students in an education system. Increasing students' digital knowledge, skills, and abilities requires using and supporting digital technologies and appropriately trained educators. Another digital outcome is creating and accepting new credential options like digital badges and nonformal education certificates. It is a digital outcome when digitization is used to enlarge private provision of education in response to reduced public funding for education (Qayyum & Zawacki-Richter, 2018, p. 129).

Digital outcomes can also include plans to foster digital outcomes in a country's education system. Even before the pandemic, there was an accelerating interest in institutional and government policies in digital outcomes in many countries. China's informatization plan states the importance of fostering digital skills, computational thinking, personalized learning, and autonomous learning (Yan & Yang, 2021, p. 424). European Union policy documents regularly indicate that digital competencies are an important goal to meet the needs of a digitally transforming European economy and society (EU, 2020). In South Korea, the motto "digital education for all" is found throughout government education branches (Korea MSIP, 2016, p. 51). Whether or not this is realized, it shows aspiration to specific digital outcomes.

---

## Digital Transformation After the Pandemic

The pandemic was a black swan – an improbable and unpredicted event – that left most countries scurrying to make emergency provisions in order to keep education systems functioning. However, the pandemic has shown which dimensions are most

important for digitization of education if the world or countries encounter gray rhinos – high impact and likely threats that should not be ignored – like climate disaster or future pandemics.

It is already well-documented and researched how most countries made changes to provide educational access at all levels during the pandemic (Bozkurt et al., 2020; UNESCO, 2020). The limited or closed access to the physical spaces of education immediately tested the digital assets and infrastructure of all countries affected. Covid-19 is a revealer and its biggest revelation has been inequity (El-Erian & Spence, 2020). It has exposed inequities in health care most obviously but also in education. The pandemic exposed inequities in the digital assets of countries' education systems. Digital assets became a sine qua non for education. Developing countries like China, India, and Turkey had moderate levels of digital assets (e.g., Internet access). So, governments in these countries combined digital technologies with on-air technologies to provide education. Developed countries that had digital assets and infrastructure pivoted to "remote teaching," and later to online, hybrid, and "HyFlex," as their main source of education provision. To keep formal education open, schools and universities spent a lot of money and time on digital assets to ensure students at all levels had the physical devices and network connectivity.

However, even in developed countries, many people did not have digital assets such as access to devices and connectivity. In the United States in 2021, nearly one-third of students stated they had unreliable computers, and over 20% said they had glitchy or no Internet access among 1300 higher education institutions that moved to online education (Schnieders & Moore, 2021, p. 4).

There has been no shortage of digital use - digital engagement with the processes of education – as much of the world tried to go online for everything. Synchronous tools became especially common for educational provision, often in attempts to replicate onsite classrooms for better or for worse. Remote education became the norm. In many developed countries like Australia, Canada, and Germany, the digitization of education was growing before the pandemic. Digitization accelerated during the pandemic as the future was pulled forward. Countries that were still mulling digitizing education have been forced to move toward digitization quickly. For example, if there was hesitation in India about online education, there is now commitment to grow digital use for education (India, MHRD, 2020).

Digital labor assesses how digitized work is and how much support there is for workers' digital capacity. Where "work from home" has grown, nearly all work that can be digitized has been. However, teachers and faculty have been unprepared and under-supported for fully remote education. Lack of teacher and faculty training and support is a concern that has heightened during the pandemic (Bates, 2020). Additionally, a key new group of education digital workers has emerged during the pandemic: parents as "proxy educators" (Davis, Grooms, Ortega, Rubalcaba, & Vargas, 2021, p. 61). They too have been under-supported.

Lack of support during the initial emergency of March 2020 is understandable. The lack of middle term planning for training and support of educators and parents is more concerning.

Expectations during the pandemic shrunk for the outcomes of education generally and the digital transformation of education specifically. Digital outcomes quickly lessened to subsistence aspirations. Required to carry the weight of entire education systems, digital provision has had mixed success.

---

## Conclusion and Recommendations for Future Research

Digital transformation as a subject is an understudied area with many topics that are yet to be researched. A few topics are priorities:

- Which education digitization indices are important for particular countries?
- What are best practices for addressing digital labor challenges of digitization?
- What problems in an education system does digitization address?
- What is the impact of digitization on existing open and distance education institutions?

Which education digitization indices are priorities for a given country? The pandemic stress-tested the digital index. Of the four indices, it seems that for many countries digital assets and digital labor have made the crucial difference in keeping education systems afloat. This should give pause to educators and decision-makers about the immense money and resources used to create, implement, and research digital use.

This is a major practice and research issue about digitization. There is no shortage of digital tools and resources for learning. There has been a shortage of resources for digital assets and digital labor. This suggests researchers must focus more on teacher-facing challenges and issues for digitization (e.g., what are best practices for faculty development; is outsourced instructional design a fair opportunity?). If digitization is to address access, cost, and quality inequities revealed during the pandemic, education researchers and practitioners will need focus on digital access and digital labor and not just digital use.

The digital transformation is often portrayed as the future of education and is certainly well underway in many countries. At the very least, the pandemic has evinced that digitization is important during times of emergencies. It may no longer be constructive to ask, “should education systems digitize?” A more meaningful research question is “to borrow from Postman (1993), what is the problem for a country’s education system to which digitization is the solution?” This needs to be an ongoing research topic. Finally, as digital transformation continues, what will be the impact on existing open and distance education institutions. What is the value proposition of open and distance education institutions? This is an existential issue.

## Abstract

This chapter argues that international organizations (IOs) are struggling to fulfill their mandate for change and improvement of society across the globe, and that they have been increasingly turning to open, distance, and digital education (ODDE) as part of their portfolio. Harnessing ODDE could be described as a “light-footed solution” for IOs and discussing and ideating around ODDE can be achieved without directly coming into conflict with the political and regulatory framework conditions of a specific country or region that formal educational systems and their institutions are usually entrenched in. This creates a situation in which there is a common discourse among IOs around the challenges that online and distance education should be tackling and an expectation that digital solutions can contribute to them. It is, however, also important to note that IOs focus on setting agendas and norms, but do not implement practices. This leaves a huge gap for ODDE that should be filled by research on what is implemented and “what really works,” but also why certain configurations around ODDE work in certain settings. This may require a more inclusive research framework with a focus on non-formal learning environments. Linking ODDE research to more expansive ideas of “learning in the wild,” that is, also outside of formal settings,

**Introduction**

This chapter will look at the link between international organizations (IOs) and developments in the field of open, distance, and digital education (ODDE). Certainly, IOs such as UNESCO or the World Bank are key actors in our globalized world. But they are also struggling to remain relevant. As a recent book diagnosed, IOs were created in a world dominated by administrative processes and political protocols. Bjola and Zaiotti (2020, p. 33) explain: "IOs were designed and tuned by their political masters to respond to the exigencies of the industrial age that worked like a CLOCK – Complicated, Logical, Ordered, Closed, and Kinetic. They have struggled to adapt to the digital reality, which is Complex, Large, Open, Unpredictable, and Dynamic (CLOUD)" (p. 33). They propose that IOs should focus on "a networked redesign, an innovative outreach, interoperable processes, and value-creating visibility" (p. 35). For experts and organizations from the field of ODDE, this provides opportunities to harness and utilize the insights from IOs to improve the quality of discussions and implemented practice concerning open, distance, and digital education.

As Parag Khanna wrote in his manifesto for "mega-diplomacy," the only appropriate response to our interconnected world is "... global governance. ... a bricolage of movements, governance arrangements, networks, soft law codes, and other systems at the local, regional and global level" (Khanna, 2011, p. 2) – and this is certainly the purpose of IOs. In today's interconnected world, many countries, regions, institutions, and individuals are dealing with the same challenges and finding solutions, as interconnectedness has led in part to a similarity of environmental conditions. Indeed, it is this assumption that the United Nations 17 sustainable development goals (SDG) are built on, and we see these goals being applied globally, regionally, and institutionally in the public and the private sectors as a reference framework. Moreover, the SDG framework is a good example of the mandate and legitimacy of IOs – they fulfill their mandate, when they bring together multiple actors for collaborative discussion and exchange, and foster solutions on how to collectively solve some of the world's greatest problems.

It follows that Abbott, Genschel, Snidal, and Zangl describe IOs as "orchestrators of change" (2015). They co-design responses and common activities by providing stakeholders with ideational and material support. That is to say that they are acting carefully and diplomatically, but ultimately as the "entrepreneurs" of policy change – this is the concept of ideation as a strategy (Swinkels, 2020). From a legitimacy

perspective, this also means, however, that while they encourage preferential solutions to particular policy problems, they usually lack the mandate to enact them. In this way they work indirectly, as they are dependent on intermediaries to implement these solutions, and using a form of soft governance, as they are unable to force compliance.

So what type of impact might IOs have on education and in particular ODDE? There has been a long tradition of IOs both promoting digital learning as solution (we term this “ideation”), but also in setting up coalitions for implementing international collaborative operations around these ideas (in the broadest sense, we might call these “technologies”). In both cases, this has been based on a set of assumptions about distance solutions in education. The problems ODDE is expected to address and the technology solutions proposed will be elaborated in this chapter.

But first, it is necessary to start out with a brief definition of distance education and a brief description of its scope, as already expressed in the term “open distance and digital education.” In his analysis of common definitions, Saykılı (2018) proposes the following to encapsulate the main elements of distance education as it is viewed today:

Distance education is a form of education which brings together the physically-distant learner(s) and the facilitator(s) of the learning activity around planned and structured learning experiences via various two or multi-way mediated media channels that allow interactions between/among learners, facilitators as well as between learners and educational resources. (p. 5)

This definition already highlights some of the main aspects of distance education that make it attractive to international organizations and multilateral actors:

- providing learning opportunities irrespective of physical distance,
- learning is supported through “facilitators” and through interactions between learners, between learners and facilitators, and between learners and learning content.

In this way, education can be offered in a more flexible format, as it is not dependent on physical nearness. In the past much of this learning was provided through paper correspondence that was sent by post to the learner. However, the internet and digital connectivity has supercharged flexibility of delivery, so that digital and more interactive media enable access and learning opportunity delivery very quickly (depending on the connectivity limitations of the learners). This is also one meaning of “open” within the term “open distance and digital education” – that is, access to provision is not dependent on specific “opening times.”

Furthermore, ODDE is not dependent on teachers to drive and manage the interaction in the learning space. This is why the definition talks of “facilitators” and includes various facilitators of learning including teachers, but also other learners and also interactive content – very much following the Miyazoe and Anderson’s “interaction equivalency theorem” (Miyazoe & Anderson, 2010, 2013)

which argues that a good quality learning arrangement is dependent on the strength of two of these interactions – between teachers and learners, between learners, and between learners and content. Not all three. This is a second meaning of “open,” as a more open framework is expected to enable more inclusive learning environments.

Finally, the definition speaks of “learning” and not “education” thereby emphasizing the trend in distance education to encompass learning formats outside of the formal education system, again in the hope of becoming more inclusive to different learning formats and to different interests of learners. Indeed, to be more learner-focused.

What the definition does not mention (but this is dealt with in the cited article from Saykılı) is the importance of the concept of “open educational resources” (OER) to ODDE. This is perhaps because OER describe instead a characteristic of the content used in the learning arrangement, not the learning arrangement itself. The term “open” in OER refers to openly licensing learning content to facilitate adaptation of learning content developed for one specific context to better fit the objectives and purpose of a new context (Orr, Rimini, & van Damme, 2015). In a digital setting, where good content is key to a good learning environment, easing the preconditions of adaptation to a new context is both efficient (under the slogan: re-use first) and effective (as it can be adapted to better fit the needs of a new learner group).

It is clear that all these elements will be attractive to international and multilateral organizations keen to facilitate the improvement of learning opportunities in countries or regions. Harnessing ODDE could be described as a “light-footed solution” and discussing and ideating around ODDE can be achieved without directly coming into conflict with the political and regulatory framework conditions of a specific country or region that formal educational systems and their institutions are usually entrenched in. Of course, this does not guarantee final implementation of solutions or indeed implementation in the way initially conceived. But seen from a legitimacy perspective, one would anyway expect global blueprints for ODDE to be implemented with specificity in their final context.

---

## Current Challenges En Route to a Learning Society

Even before our highly interconnected digital society, there were strong arguments to view educational practice as an international playing field, where practices and norms are being discussed and renegotiated in a global setting. This argument was put most prominently in the “world polity” theory initiated by John W. Meyer, who saw the emergence of a kind of standard model for schooling, for universities and even for the organization of science (Boli, Ramirez, & Meyer, 1985). Rather fittingly, this theory itself has also been criticized for not being so much a “disinterested theory,” but indeed promoting norms and ways of thinking about education as a set of norms and values, which perhaps accounts for its popularity within the field of IOs (Carney, Rappleye, & Silova, 2012). This process of isomorphism, but also of more direct agenda setting, has certainly been promoted through the influence of IOs and international publications like the OECD’s annual publication “Education at a Glance” (OECD, 2020) and UNESCO’s “Global Education Monitoring Report” (UNESCO, 2020b).

A common focus of this global debate has been how to help countries and regions become a learning society, when access to formal education is a scarcity and often only accessible to a person during an initial period of their life. So, the two main discourses around this are access for all (which is a challenge in low-income countries with low capacity in formal education and growing youth populations, but also in other countries where access is still determined by socioeconomic characteristics), and huge changes in the labor market or in our societies (e.g., in the context of digital transformation). In both cases, there tends to be agreement on these challenges whether argued from an economic or social justice position.

It is about helping people attain their highest potential, gain better lives, and contribute to their local communities. Nevertheless, this formulation does not remain uncontested: in a critique of this stance as expressed in documents on lifelong learning from the OECD, Walker (2009) criticizes what she calls “inclusive liberalism,” which she aligned to the OECD goals focusing on a liberal market view and aiming to produce the “worthy citizen,” capable of contributing to economic prosperity. But at the latest by 2018, the OECD was also talking about transforming education and learning for “growth and well-being” (OECD, 2018).

This broad concept has been elaborated on by UNESCO as follows:

Lifelong education should be seen, today, as one of the preconditions for development conceived as an ability for adaptation and autonomy, as well as a means for ensuring the sharing and flow of knowledge worldwide. Lifelong education can provide a response to the growing job volatility that most forecasters predict. Increasingly, people will be changing jobs several times in a lifetime, and education can no longer be limited to offering a single specialization, but must develop each person’s ability to change course during his or her lifetime, and to cope with economic and social change. (. . .) Lifelong learning is a process that should ideally be meaningful at three levels (. . .): personal and cultural development – the meaning a person gives to his or her life; social development – one’s place in a community, citizenship, political participation and living together in society; and, lastly, professional development – stable quality employment and its links with production, job satisfaction and material well-being. (Bindé, 2005, pp. 77–78)

This expectation for a learning society can be linked to the objectives of the UN Sustainable development Goal 4: “Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all.” Still, in the recent UN progress reports (2019, 2020 – see <https://sdgs.un.org/goals/goal4> for all data referenced below), the authors state very clearly that the goal of SDG 4 will not be reached by 2030, unless innovative solutions are sought. And a juxtaposition of the education data (SDG4) with the innovation data (SDG 9) spells out the challenge – limitations in educational provision, on the one hand, and demands for higher skill levels for career development, on the other:

Referring to SDG4 – Education:

- In 2018, some 773 million adults, two-thirds of them women, remained illiterate in terms of reading and writing skills. The global adult literacy rate, for the population 15 years of age and older, was 86% in 2018, while the youth literacy rate, for the population 15–24 years of age, was 92%. Southern Asia is home to

nearly half of the global illiterate population, and sub-Saharan Africa is home to a further quarter. Globally, if more adults are literate today than they were, it is mostly because more adults went to school when they were young rather than because adults who did not go to school had a second chance to learn.

- Based on data from 129 countries, the percentage of primary school teachers receiving the minimum pedagogical training according to national standards throughout the world has stagnated at 85% since 2015. The percentage is lowest in sub-Saharan Africa (64%) and Southern Asia (72%).

Referring to SDG9 – Industry, innovation, and infrastructure:

- In 2016, medium-high and high-tech sectors accounted for 48% of the global manufacturing value added. Medium-high and high-tech products continued to dominate manufacturing production in Northern America and Europe, reaching 47% of the manufacturing value added in 2016 compared with 10% in least developed countries.
- Almost all people around the world now live within range of a mobile-cellular network signal, with 90% living within range of a 3G-quality or higher network. This evolution of the mobile network, however, is growing more rapidly than the percentage of the population using the Internet.

These issues are not at all specific to low-income countries nor to the United Nation's reporting, and similar reports can be found from the World Bank and from the OECD. The difference in middle- to high-income countries is that the challenges are not felt by the majority of a population as in low-income countries, but by those from the lower socioeconomic groups in society.

This main narrative of IOs can be linked to an assumption that digital technologies (or – as often described in UN documents – “Information and Communication Technologies”) can make a significant impact on the achievement of these goals. In 2015, the Qingdao Declaration from UNESCO, entitled “Leveraging Information and Communication Technologies to Achieve the Post-2015 Education Goal” was signed at the close of an international conference attended by over 500 people from 100 countries, including both public and private sector representatives. It picked up the topic of inclusion and lifelong learning, attesting a high potential to online and distance learning technologies (UNESCO, 2015, p. 5):

Inclusive and relevant lifelong learning: On this theme, participants reached the consensus that skills development and lifelong learning are among the post-2015 education priorities, and that the omnipresent digital devices and online content are powerful levers to: (1) expand access to both formal and non-formal learning opportunities in order to reach out to more learners; (2) multiply learning pathways and diversify learning approaches through various platforms and resources to attend to different teaching and learning needs; and (3) enable blended learning and learning in changing environments.

This commitment was echoed in the Qingdao Statement from 2017 (UNESCO, 2017). Although neither distance education nor online learning was mentioned explicitly as terms, “fostering digital innovations for education” was.

A new dynamic was given to this discussion and to the expectation of digital learning by the Covid-19 pandemic. In this case, online learning was really seen as the only game in town. Organizations in public and private sectors alike switched where possible to online delivery of services and thereby accelerated any debates on the use of digital technologies. This was equally the case in education and learning and was seen as a way to fast-track digital technologies as part of the “new normal” for learning delivery. In the rush for solutions, however, it was noted in various reports that it was important for the public sector to play a key role in service delivery and the formation of digital learning as a public good, and not only leave this up to private players in the market (UNESCO, 2020a).

In sum, this short review has aimed to show that there is a common discourse among IOs around the challenges that online and distance education should be taking on and an expectation that digital solutions can contribute to addressing these challenges. Against this backdrop, various multilateral and individual initiatives from IOs have been launched. Their common shape and purpose will be reviewed in the following section. It should be noted already, however, that IOs work on setting agendas and norms. This leaves a huge gap that should be filled by research, which really does look into “what works,” but also why certain configurations around ODDE work in certain settings. We will return to this situation later in the chapter.

---

## A Review of the Shape of IO Activities and Their Significance for the Field of ODDE

So, while IOs promote the idea of using digital learning in white papers and policy blueprints, how can they hope to achieve an impact in practice? This chapter presents some key examples of measures that have been undertaken by IOs. For ease of recognition, they have been structured around these methods of influence:

1. **Ideation:** IOs aim to stimulate national or regional initiatives through ideation and policy exchange.
2. **Digital infrastructure projects:** IOs contribute to the development of digital solutions, which are by their nature global, but can be harnessed in a local setting.
3. **Multi-stakeholder networks:** IOs orchestrate a mixture between local and global solutions through international partnerships, while encouraging local adaptations.

### Ideation Through Guidelines and Consultancy Work

In the first instance, the ultimate expectation is a sort of “flat world” approach, that is, the assumption that there is a good solution to a problem and it can be implemented within any national or regional settings through providing enough information about these solutions and supporting implementation (Friedman, 2007). Ideation work includes giving examples, recommendations and consulting on national or regional policy papers or master plans. This is a common approach

for IOs, especially in connection with in-situ consultancy, where a consultant or a group of consultants is asked to review the context in a particular country or region and make recommendations on possible reform steps. One illustration of the type of key document used is the UNESCO “Guidelines for Open Education Resources Policies” published in 2019 in collaboration with the Commonwealth of Learning (Miao, Mishra, Orr, & Janssen, 2019). This publication is a typical example of an IO promoting ideation around a particular idea for educational reform. This publication presents a seven-step process to policy development with a focus on OER and while it does not specifically promote ODDE, it does argue for digital learning provision to be a key element to any OER policy: “OER should be used to provide new educational content to learners in a digital online format that can be accessed online. Additionally, it will also be important to consider how learning acquired in a non-formal or informal setting through OER materials can be accredited and recognised for future formal learning pathways” (Miao et al., 2019, p. 23).

The purpose of this publication is to make a link between general global policy work promoted by UNESCO, for example, with its recommendation on OER and the associated action plan, and the specific work of UNESCO and NGOs in countries to support policy work, which includes OER as part of the solution to educational reform. As stated in the introduction by Assistant Director-General for Education UNESCO, Ms. Stefani Giannini:

UNESCO and the Commonwealth of Learning have been working directly with governmental agencies and institutions to support the development of national and institutional OER policies. This publication, Guidelines on the Development of Open Educational Resources Policies, is the culmination of this. It is meant to be referenced as a hands-on plan to develop subject-matter knowledge for policy makers on OER and a framework to provoke critical thinking on how OER should be leveraged to address challenges in achieving the targets of Sustainable Development Goal 4 (SDG 4) in different local contexts. More specifically, it can be used as a literal step-by-step guidebook on how to develop an OER policy from conception to implementation. (Miao et al., 2019, p. 4)

The first chapter describes this link, while the subsequent chapters delineate an idealized policy development process and end in each case with questions that could stimulate the formulation of an OER policy appropriate to the specific context. It has been published in English, French, and Spanish and is itself openly licensed – all of this motivated by the wish for it to be as accessible a resource as possible.

The weakness of such an initiative from the IO perspective is that this can only provide a framework for implementation. The implementation remains with the actors within countries and regions, who have the mandate and the resources to implement them. Naturally, if used by teams of external consultants from an IO like UNESCO, who are charged with supporting policymaking processes in a specific country or region, this can help to ensure that OER policies become part of new educational practices.

## Digital Infrastructure Projects

A more direct version of influence in the field of ODDE is implementation of a solution in a new setting, based on the knowledge that it has worked in other settings. Two examples will be presented for illustration here:

- The African Virtual University, established in 1997 through a world bank grant and newly re-formed and launched as the Pan-Africa Virtual and E-University in December 2019 (Sawahel, 2020).
- The atingi digital learning platform, established by the German Federal Ministry for Economic Cooperation and Development in December 2019 (*full disclosure: the author is part of the management team of atingi*).

### The African Virtual University

The original idea of the African Virtual University (AVU) was to confront the problems of access to high quality learning in higher education through harnessing new technologies of learning design and delivery (Prakash, 2003). The AVU project was built on the use of information and communication technologies, initially enabling students in six African countries to take courses and seminars taught by professors from universities outside of Africa (AVU, 2015; Missen, 2001; Munene, 2007; Nafukho & Muyia, 2013).

In the initial stages, instructors delivered their lectures in front of television cameras in their own classrooms, and the video was routed to an uplink in Washington, DC, which then beamed it via satellite to centers of learning in Africa. Over time, more interactive technologies were utilized. However, the basic premise remained: students of AVU would be supported in their development through access to high quality learning from scholars in the USA and other “developed” countries. The AVU was coordinated from Washington in the first phase, but in 2002 it was re-established as an NGO in Kenya. Despite this, the initiative has struggled to become the distance learning institution for Africans from Africa through most of its lifecycle. There have been various analyses of the AVU which generally criticize the “foreignness” of the initiative, which was not built in Africa as a partnership, but as a shell-solution implanted in a new context.

In the most recent publicly available strategic plan, AVU confronts some of these problems head on. It states that it now has a stronger focus on content from partners in the region and on regional needs: “The AVU has phased out its academic programs (certificate, diploma and degree) brokered from foreign universities. AVU is now collaborating with a wide number of partners, including governments, universities, development partners and the private sector to offer new programs and courses designed to respond to the demand of the African labour market” (AVU, 2015, p. 15).

And the most recent development has been the merger of AVU with the Pan-African University (another donor country initiative, which was indeed lacking

a digital learning arm) as part of the African Union's strategy 2063 in 2019 (Sawahel, 2020). The newly formed Pan African Virtual and E-University (PAVEU) now hopes to truly become the distance learning institution for Africans from Africa, and has a fitting vision and mission to express this (see <http://paveu.africa-union.org/about-us/>):

- Vision: "To be a leading centre of excellence in providing open access to online higher education and research for the advancement of Africa."
- Mission: "To provide world class inclusive quality-assured and relevant education to Africans anytime and anywhere and to conduct innovative research to catalyse the African Union's Agenda 2063."

This impulse from the IO World Bank can certainly be criticized for its naivety and lack of local embeddedness. In the meantime, the AVU has cut itself free from the baggage of "foreignness" in the original inception and from the pure focus on university processes, which severely limited the attractiveness of its offer for target groups other than existing students in Africa. The sustainability remains an open question, but a stronger focus on creating a network of partners could help here, as the new AVU will then no longer be competing, but collaborating with other providers.

### **Atingi Digital Learning Platform**

Digital learning platforms are proliferating among IOs. Examples of United Nations initiatives are the International Telecommunications Academy (ITU Academy), the Learning and Knowledge Development Facility of the United Nations Industrial Development Organisation (UNIDO), and indeed the United Nations System Staff College (UNSSC), which is beginning to open up its courses to the general public. The main example from the World Bank is the Open Learning Campus (OLC).

In each of these cases, the IOs are using their digital learning platforms to reach more people and to better fulfill their objective of encouraging change and improvement through knowledge proliferation and knowledge exchange. The example to be elaborated on below is not in fact from an IO, but from a national ministry, but it is fully based on partnering with IOs and national and local partners.

The atingi digital learning platform was initiated by the German Federal Ministry for Economic Cooperation and Development in December 2019 with the goal of facilitating access to knowledge and exchange through digital and blended learning across the globe (Bundesministerium für wirtschaftliche Zusammenarbeit und Entwicklung, 2021, p. 120). This is expressed in the mission of atingi: "Our vision is a world in which digital learning is inclusive, accessible, relevant, safe and secure for all" (see [www.atingi.org](http://www.atingi.org)). This goal is coupled with very ambitious quantitative goals for the platform, which in its current – inception – phase reached well over 400,000 registered learners and 120,000 completed learning units by December 2021. Currently it has a focus on Africa and around two-thirds of learners come from the African continent.

Similar to the United Nations initiatives and the World Bank platform, atingi is also explicitly following two additional internal goals for the platform which serve to help the German government reach its own goals:

- to fully integrate digital learning into the international capacity development work of the German government, and,
- to showcase how scaling of international development work can be facilitated through digital solutions.

This means that atingi is not simply a learning platform launched into the world in the hope that it might solve the problems of scarcity of learning opportunities in general, but it is specifically being used within the context of German development work and to support the over one hundred new capacity-building projects across the world being implemented by the Ministry and its operational agency, the GIZ, annually. This should ensure that it is an initiative fully integrated into the work of German development across the world. It certainly presents a qualitative difference to the way that AVU was launched by the World Bank, as an external solution “for” Africa.

There are two big differences between AVU and atingi at their inception points, although the current discussions concerning AVU suggest that their positions are nearing:

- atingi has always been focused on nonformal learning first; this is largely to do with the fact that the German development work which it should be amplifying and strengthening is usually about capacity-building as part of societal and economic transformation processes, and is not simply focused on formal education provision. Nevertheless, this leaves atingi with the challenge of how to ensure learning on the platform is recognized by third parties (e.g., employers) and is therefore ultimately “valuable” and even “transactional” for the learner.
- atingi is being developed at a time where digital technology is more focused on open source solutions and international technical standards, which facilitate links between platforms and help avoid the so-called “walled garden approach,” where a learner’s activity on one platform cannot be transferred to another platform (think: what you do on LinkedIn, Facebook, or TripAdvisor can only be viewed on these platforms). However, this leaves atingi with the challenge of how to be both a member of greater ecosystems and retain its own identity and coherence.

In both cases, atingi and any other initiatives following similar strategies will have to work against the common “isomorphisms” or “world polity” of educational provision, which assumes the norms of formal education to be the ultimate reference, and the norms of market competition to be the ultimate markers of success. These are issues the AVU has struggled with (as well documented in the respective literature – see above) and are key points of contention for ODDE as a whole.

## Multi-stakeholder Networks

A third way in which IOs can impact on ODDE is through creating multi-stakeholder networks for certain topic areas. This is a way of bringing together both the ideation component of work by IOs with the chance to offer solutions, which can be used or replicated in different settings. Perhaps most important is that IOs can really harness their “orchestration” characteristics by bringing these components together in a manner not normally possible within a national or regional setting.

In some cases, these networks are set up by IOs, in others they are set up by international membership organizations, but with patronage from IOs such as UNESCO.

## UN-Based Networks and Coalitions

A first example is around digital capacities needed to support digital transformation across the world. The initiative for digital capacity set up by the United Nations Secretary General’s Envoy on Technology, along with the United Nations Development Programme (UNDP) and the International Telecommunication Union (ITU), has set up a multi-stakeholder network to forge a concerted effort at scaling up digital capacity building solutions. It has a website, which went live in April 2021. It was initiated on the back of recognition that:

...a large part of digital capacity-building has been supply-driven as opposed to needs-based. Insufficient investment also remains a significant limiting factor. Moreover, digital capacity-building has to be tailored to individual and national circumstances. Given variances within and among countries and regions, there is no one-size-fits-all approach, and better evidence is therefore needed of which capacity-building approaches are most effective, considering political, economic and social contexts. To overcome these challenges, two aspects are central: greater coherence and coordination in capacity-building efforts; and a concerted effort at scaling up solutions. (United Nations, 2020)

The initiative is working with external partners and NGOs to build a database of existing digital skills training, to support the matching of demand for these trainings to suppliers of them, and to convene a multi-stakeholder network promoting a more holistic and inclusive approach to digital capacity development. This means in terms of ODDE, the website will be an aggregator platform, linking out to relevant learning materials and learning opportunities on partners’ websites.

A similar example is the Global Skills Academy, set up by UNESCO in 2020 as part of its Covid-19 response under the umbrella initiative entitled “Global Education Coalition” (UNESCO, 2021). This initiative also aims to curate and link out to learning resources, but with a focus on technical and vocational training and employment-ready skills for recovery. Again, it brings together partners from different United Nations agencies, the private sector and NGOs. Through harnessing huge network structures and partnerships, the Global Skills Academy is able to follow ambitious goals. It plans to “help one million young people build skills for employability and resilience between 2020 and 2021” (see website: <https://globaleducationcoalition.unesco.org/global-skills-academy>), and furthermore aims to foster common

innovations in education between the partnering organizations, such as common digital credentials.

This means that such initiatives can galvanize concerted efforts to support global goals, and even to promote common innovations through building on common interests. However, in contrast to the initiatives of AVU and atingi, described above, what they cannot do is fully develop the actual solution being implemented.

### **International Networks Endorsed by IOs**

As mentioned above, a further form of interaction of IOs is when these endorse or support networks from independent organizations. There are many such networks familiar to the ODDE scene. Examples are the International Council for Open and Distance Education (ICDE) and Open Education Global (OE Global), both with endorsements from UNESCO.

Such efforts are particularly interesting from an IO perspective in the sense of what Carayannis and Weiss call the “Third UN” with reference to United Nations structures (Carayannis & Weiss, 2021). This concept recognizes the limitations of what IOs can actually do and what they tend to think, as they are constrained by rules, regulations, and common reference points. Their structures can bring governments together and forge alliances (the authors call this the “First UN”), their staff can bring prepare white papers and analyses (the staff are called the “Second UN”), but for this work to remain relevant and to keep in touch with real challenges, they need links to the outside world, to real practice, and to discussions in the field. Thus, Carayannis and Weiss refer to intellectuals, scholars, consultants, think tanks, NGOs, the for-profit private sector, and the media as the “Third UN”:

The Third UN’s roles include research, policy analysis, idea mongering, advocacy, and public education. Its various components put forward new information and ideas, push for alternative policies, and mobilize public opinion around UN deliberations and projects. (ibid).

This gives multilateral organizations that are not governmental bodies (e.g., ICDE, OE Global) a very important role in the field of ODDE. They have the chance, but also the obligation to shape the ideation of IOs, by bringing in new ideas and exchanging critical knowledge on what works in practice. They can do this through joining larger multi-stakeholder initiatives such as the Global Education Coalition or through introducing IOs to their own working groups and events.

---

## **Conclusion: Suggestions for ODDE and IOs**

This chapter has highlighted the fact that key narratives of IOs in education give ODDE a major role in providing appropriate solutions to the problems of access to high quality learning opportunities and skills development for decent work, well-being, and community development. It has also argued that IOs are themselves confronted with the challenge of having an impact on solving these problems, and

if they do not manage this well, they will lose relevance and legitimacy (Bjola & Zaiotti, 2020).

The chapter shows that there is a productive dependency between IOs and experts, specialists, and institutions from the ODDE field in the following ways.

Representatives of the ODDE field can make reference to IOs' major narratives to strengthen arguments for the key role which ODDE can play in today's education systems. Certainly, this is a strategy that would be suggested by the policy theory of John Kingdon – who sees such actions as creating productive “policy windows” (Kingdon, 1993). This helps representatives of the ODDE field to gain support for their work in national and regional settings, where debates and developments might be more determined through national politics than through meeting today's grand challenges.

Furthermore, representatives of the ODDE field can make use of policy frameworks or discussion forums set up by IOs to learn from other cases around the world. This helps to ensure that individual practices of ODDE are informed and stimulated through lessons learned and encourages review of current strategies and practice. Here there also appears to be a stronger mandate for ODDE research than is reflected in some of the recent research reviews (Zawacki-Richter et al., 2020; Zawacki-Richter & Anderson, 2014), where there is a preference for discussing ODDE in the context of higher education (even when it is discussed in the framework of “opening up” higher education). Non-formal learning is no longer simply learning that needs policy to become recognized as formal learning, but it is an opportunity to strengthen, enrich, and extend learning pathways (Latchem, 2018). All of which are relevant to IOs. Linking ODDE research to previous ideas of “learning in the wild,” that is, also outside of formal settings (“Learning in the wild,” 2010), will better reflect both the reality of learners in today's digital world, and provide a better foundation for contributing to better IO policies and practices.

For their part, IOs need to be closely linked to representatives of the ODDE field, in order to avoid naive solutionism, such as planting solutions in a new context without due respect to local conditions, systems, and networks. There is a particularly strong tendency for this with digital solutions, where the whole debate about “appropriate technology” that started in the 1970s is experiencing new interest – see the recently translated book on “low tech” from the French author Philippe Bihouix (2020). This role – which requires new and directed contributions from ODDE researchers – was argued above under the rubric of the “Third UN.” Such a tight linkage can help IOs remain relevant and help to maintain the legitimacy of their expertise for ideation processes. We already see evidence of IOs creating inclusive processes through multi-stakeholder networks to bring together expertise from consultants, think tanks and NGOs, but it is important that research can inform such debates beyond norms and agenda – and beyond what Zawacki-Richter et al. (2020) call “lip-service.” So, it is of great benefit to the ODDE field to get involved and indeed will help progress in the field. Digital formats for communication can be used by IOs to ensure that participation is not solely dependent on the ability to travel to physical meetings and to widen the group of stakeholders participating in such processes.

Achieving a positive impact of IOs on ODDE is therefore dependent on both sides opening up channels for discussion and change, and depends on ODDE taking up the research challenges facing IOs in their work to set agendas and frameworks and to launch specific initiatives. The circumstances are ripe for such interaction and this chapter recommends fully exploiting these opportunities to ensure ODDE is an integral part of the solution to make learning opportunities accessible and valuable for all.

## Abstract

Open educational resources (OER) have generated a considerable amount of attention in recent years in the field of open, distance, and digital education (ODDE). Digital knowledge infrastructures of different kinds have enabled the creation, storage, management, sharing, and adoption of these resources across educational sectors, levels, and geographies. This chapter presents a general overview of these infrastructures, the underpinning models of OER provision, main characteristics, and key insights from research. It draws on the literature and discusses examples purposively selected to illustrate the diversity of scope,

educational stages, and types of online OER infrastructures established on a global, national, regional, or institutional scale. Key challenges are also discussed, including licensing issues, concerns about quality assurance, metadata problems, the sustainability of the initiatives, and sociocultural aspects, among others. In addition to revisiting the conception and adoption of OER in different cultures, important topics to be further addressed by future ODDE research are presented.

**Introduction**

The term OER was first proposed in 2002, at a UNESCO forum. While other concepts (e.g., “open content”) had already tried to bring to education the principles underpinning the free software and open source movements (Wiley and Gurrell 2009), the new term helped galvanize a global community into action. Over the last two decades, a wide range of actors – including policymakers, institutional leaders, educators, students, philanthropists, and governments – have engaged in the promotion of (open) educational practices that involve the creation and release of learning resources as OER.

In 2019, UNESCO’s General Conference adopted the Recommendation on Open Educational Resources, according to which OER are “learning, teaching and research materials in any format and medium that reside in the public domain or are under copyright that have been released under an open license, that permit no-cost access, re-use, re-purpose, adaptation and redistribution by others” (UNESCO 2019).

The definition, agreed after a consultation with diverse stakeholders, is compatible with licenses that prevent certain kinds of reuse (e.g., commercial), a stance contrary to certain views within the OER community advocating to avoid restrictive conditions for reuse.

This chapter focuses on digital knowledge infrastructures devoted to the creation, storage, management, and sharing of OER across diverse educational levels and geographies. While the word “infrastructure” is often associated just with technology, we adopt a broader socio-technical perspective and therefore approach knowledge infrastructures as ecologies or complex adaptive systems that “consist of numerous systems, each with unique origins and goals, which are made to interoperate by means of standards, socket layers, social practices, norms, and individual behaviors that smooth out the connections among them” (Edwards et al. 2013, p. 5). OER and MOOCs are examples of such knowledge infrastructures and are key to understanding the work of the digital in the enactments of open education (Edwards 2015). In particular, we use the term “OER infrastructures” to talk about knowledge infrastructures articulated around the goal of providing access to educational resources that are either in the public domain or available under an open license.

The chapter reviews several OER initiatives with the aim of illustrating relevant types of experiences with different scopes and ambitions rather than offering an exhaustive catalogue. Educational levels are represented with acronyms, except from pre-K12, K-12, and schools: higher education (HE), continuing education (CE), lifelong learning (LL), and vocational education (VE).

---

## Typology of Online OER Infrastructures

The idea that sharing educational content as freely and openly as possible on the World Wide Web may democratize learning opportunities is one of the key principles underpinning much of the discourse and practice on technology-mediated education, although its limitations have been increasingly recognized in the literature (Bayne et al. 2015) and the focus has increasingly shifted from the content to how communities engage with it.

The redefinition of open education through the rise of OER and the emergence of other open educational practices (OEP) cannot be understood without the Web as the basis for a global knowledge infrastructure, where technology and social dynamics have coevolved to form complex information ecologies.

Figure 1 shows various types of digital knowledge infrastructures, some of which are regarded as OER infrastructures. It is worth noting that it includes two types of infrastructures that may, or may not, operate as OER infrastructures. In the case of MOOCs, while they are key to understanding current trends in OEP, many of these courses are content-based that cannot be regarded as OER. In this regard, educators involved in the creation of MOOCs often do not intend to create OER or perceive it as important (Hodgkinson-Williams and Arinto 2017), despite being concerned with other aspects of OEP. In the case of open-access repositories, they are represented as entities that can work as OER infrastructures, especially when they contain collections specifically dedicated to providing access to educational resources. Even though UNESCO's definition of OER explicitly includes "research materials," in this chapter we primarily focus on initiatives devoted to sharing resources that have been specifically created for pedagogical purposes.

Therefore, this section provides an overview of different models – not necessarily associated with specific technologies – for the creation and sharing of OER, drawing on major theoretical and empirical insights from research, historical trajectory, and controversies on the topic.

### OER Repositories

An online repository is a special type of website created to store large collections of artifacts in a highly structured way, thanks to the use of detailed metadata. DSpace is, for example, a widely used software package chosen by HE institutions from all over the world to run their repositories. While they are most often dedicated to storing research publications, they might also include collections of teaching and learning

**Fig. 1** Relations between digital knowledge infrastructures and OER infrastructures

resources, and there are also repositories entirely focused on educational content and, more specifically, OER.

The history of OER repositories (ROER) dates back to the first steps of learning objects in 2000 in the context of distance education and were hence called learning object repositories: central databases containing a broad range of individual learning objects. Repositories are the most widespread type of OER infrastructure, providing permanent access and enhancing visibility while enabling the search and retrieval via metadata, which are key elements to represent and organize OER (Mouriño-García et al. 2018).

ROER can be classified depending on the type of content they store (McGreal 2008): (a) online collections of archived content, (b) portals that mainly store links and metadata to materials from others (i.e., referatories), and (c) repositories that combine the role as a content provider and portal. Another type of classification is based on the nature of the content or the provider (Clements et al. 2015): (a) thematic repositories that include resources from a certain topic, (b) national repositories that relate to nationwide portals that include contents for all topics, and (c) federated repositories (aggregators) that harvest metadata from other repositories.

There are some review studies on OER repositories but focused almost exclusively on HE. For instance, the review by Santos-Hermosa et al. (2017) of 110 ROER in HE found out that more than 75% were institutional repositories (the rest were national repositories), and most of the ROER examined have been created in Europe (over 70%) and North America (over 15%). Also, findings from three HE qualitative studies described in a systematic review (Rodes-Paragarino et al. 2016) highlight (a) that the implementation of local repositories increases the use and reuse of OER; (b) the importance of considering technological, cultural, and pedagogical aspects when integrating ROER in an institution; and (c) the preference for a subject-based repository.

## OpenCourseWare

OpenCourseWare (OCW) is a model for the provision of OER that was originally conceived, and first implemented, at the Massachusetts Institute of Technology (MIT) as the result of a “study aimed at defining and evaluating MIT’s options in the changing educational environment of the Internet” (Abelson 2008, p. 165). In the Spring of 2001, MIT launched OCW as a way of offering access to high-quality learning resources and ultimately pursuing the idea of education as an universal right (Caswell et al. 2008). Following a highly structured approach and with generous media production support, it involved the creation of a comprehensive collection of high-quality educational resources by MIT academics (Abelson et al. 2021). The use of an open license (CC-BY-NC-SA) enables not only learners all over the world to take advantage of those resources as the basis for self-regulated learning but also educators and curriculum developers to reuse and adapt to their own contexts and communities. The OCW model focuses on the provision of content for self-directed learning and self-assessment resources, but it does not offer any opportunities for interaction with either educators or other learners.

While it was predated by other initiatives with similar goals, OCW managed to build a critical mass of attention around this type of OEP, leading to the coinage of the term OER and resulting in a considerable number of university leaders all over the world becoming interested in replicating the model (Carson and Forward 2010).

## MOOCs

Massive open online courses (MOOCs) are online, open-access, and free courses that allow the enrolment of an unlimited number of students. While they are often considered under the umbrella of OER, this has been questioned (Stracke et al. 2019) as relatively few of them are fully free or carry an open license.

MOOCs were preceded by both open online courses and the OER movement but started as such with the open online course “Connectivism and Connective Knowledge” (CCK08) organized by George Siemens and Stephen Downes (Canada) in

2008. This first MOOC focused on network formation, defining the connectivist approach (cMOOC), whereas in 2011 the content-focused MOOC emerged (xMOOCs), as proposed by Norvig and Thrun (USA) (Stracke et al. 2019).

MOOCs have attracted broad attention in research in open, distance, and digital education in the last years. Some of the most salient topics are quality assurance, which is also shared by ROER, their instructional design or pedagogical model, and learning analytics (Rasheed et al. 2019; Zawacki-Richter et al. 2018).

## Open Textbooks

Open textbooks can be regarded as a specific type of OER. They have gained ground in certain contexts where the price of textbooks is particularly high, such as the USA or Canada, operating as an important barrier to access to education. Indeed, there are cases of HE institutions offering zero-textbook-cost degrees, for example, in California, where all required readings are available as open textbooks or other types of OER. This has also generated particular interest in Australia.

## Wikimedia Platforms

Wikipedia is not only the biggest and most popular OER of all times, consistently ranked among the most visited websites worldwide, but also one of the most successful examples of commons-based peer-production (Benkler 2006). Wikimedia, the US-based nonprofit organization behind Wikipedia, maintains a wider range of OER infrastructures, including Wikidata, Wikimedia Commons, Wikivoyage, and Wikibooks. All of them are wikis, a type of website that users can edit directly on their web browser, enabling them to quickly revise content and add hyperlinks. Wikimedia also maintains MediaWiki, the open-source content management system underpinning all these platforms, as well as other wiki-based OER initiatives, such as the WikiEducator community [<https://wikieducator.org/>].

---

## Global, Cross-Border, National, and Regional Infrastructures

OER infrastructures tend to be hosted at an institutional level, taking, for instance, the form of repositories, OCW sites, or open textbook collections. However, there are also joint initiatives in which several institutions and organizations within the same countries or internationally come together to launch an OER infrastructure. In some cases, initiatives that started locally reached a global scope eventually.

In this section, a non-exhaustive list of OER infrastructures has been purposely selected to illustrate the OER scene across the globe, including examples of both live and discontinued initiatives at different educational levels in the six continents. The emphasis is made on global, national, and regional infrastructures, although in some cases institutional or thematic infrastructures are also highlighted.

## Global Actors and Infrastructures

Intergovernmental entities such as UNESCO, the European Union, or the Commonwealth of Learning have played an important role in promoting OER, though instead of establishing their own OER infrastructures they have tended to support other organizations in doing so. Likewise, private organizations like the Hewlett Foundation have funded OER initiatives of different kinds globally, such as the OER World Map [<https://oerworldmap.org/>] or the Global OER Graduate Network [<http://go-gn.net/>].

The OER infrastructures discussed in this section are the result of international collaborations that involve partner institutions across the globe (i.e., in two or more continents).

### OER Repositories

One of the most global, well-known ROER is the Multimedia Educational Resource for Learning and Online Teaching (**MERLOT**) [<https://merlot.org/>], which was developed by the California State University (US) in 1997 as the university's open library of free learning resources, derived from a 1994 nationally funded project (Hanley 2015). Nowadays, the MERLOT consortium is a global initiative constituted by over 40 HE systems, individual institutions of HE, consortia, professional academic organizations, digital libraries, education industries, and over 125,000 individuals (also beyond the USA) and forms a case study of sustainability for OER projects (with a high presence of HE OER), moving from an institutional initiative to a community-sustained project (Okewole and Knokh 2016).

**OER Commons** [<https://www.oercommons.org/>] is a digital public library and collaboration platform launched by the global nonprofit US-based Institute for the Study of Knowledge Management in Education in 2007, supported in part by the William and Flora Hewlett Foundation, as part of the foundation's worldwide OER initiative. It counts with contributors from all over the world, covering all education levels.

### OpenCourseWare

Due to the large number of organizations seeking advice from MIT on how to establish their own OCW initiatives, the OCW Consortium was launched in 2006 with the aim of facilitating and promoting the adoption of the OCW model. In addition, several regional associate consortiums were established with the aim of promoting the OCW model within specific geographies, for example, the Universia-OCW Consortium in the Iberoamerican region (Latin American countries, Portugal, and Spain) and the Japan OCW Consortium, the Korea OCW Consortium, the Taiwan OpenCourseWare Consortium, or the Turkish OpenCourseWare Consortium.

After a few years, the OCW model proved to be difficult to sustain for many institutions, and its popularity declined, reflected on the rebranding of the OCW Consortium as the Open Education Consortium. Likewise, the associate consortiums either disappeared or rebranded themselves to address open education more generally too.

OCW initiatives do not rely on a centralized OER infrastructure or even use the same technologies. However, some OER infrastructures attempted to make it easier to find content across OCW sites around the world or within regions (e.g., Serendipity [<http://serendipity.utpl.edu.ec>], an OCW search engine). Likewise, associated consortiums like OCW-Universia implemented their own platforms to aggregate resources published by their members on their respective OCW sites.

## MOOCs

Most MOOC platforms follow the xMOOC model, focus on HE and CE, and were established in the USA but soon started to offer courses provided by educational institutions across the world.

**Coursera** [<https://www.coursera.org/>] was created by professors at Stanford University (USA) in 2012, as an independent for-profit technology, and currently has over 200 HE institutions and companies as partners all over the world. MIT and Harvard launched the MOOC platform **edX** [<https://www.edx.org/>] for HE in 2012, through the incorporation of their MITx platform (USA). In 2013, the platform was released as open-source software.

Also in the English-speaking realm, **FutureLearn** [<https://www.futurelearn.com/>] was launched by the UK's Open University in 2013 with a clear focus on British universities, but nowadays includes partner institutions around the world. Apart from CE courses, several universities also offer full degrees, both undergraduate and postgraduate, on this platform. A distinctive feature of FutureLearn is that all courses are based on a social learning approach, designed according to the principles of visible learning – as inspired by the work of John Hattie – and a community support model that comes from Diana Laurillard's conversational framework.

Established in Spain in 2013 as a joint initiative between Telefonica Educación Digital and Universia, **MiriadaX** [<https://miriadax.net/>] is the first Iberoamerican MOOC platform. Now it has over 100 educational partners from Latin America, Portugal, and Spain.

The **OERu** [<https://oeru.org/>] – coordinated by the OER Foundation from New Zealand and with partners in Africa, Asia, Europe, Middle East, North America, and Oceania – is an independent and not-for-profit network of universities, which provide online courses that can be taken either for self-directed interest (for free) or as learning for credit (on a fee-for-service basis).

Building on MOOC platforms, and other free online courses from around the Web, the **P2P University** [<https://www.p2pu.org/>] provides an OER infrastructure that does not focus on the delivery of content, but enables learners based in the same cities, all over the world, to form learning communities and take together, as a kind of local cohort, the online free courses offered by third-party platforms (many of them MOOC platforms). Based on peer and community learning from an equity approach, it is closer to the cMOOC approaches than to the xMOOC ones, despite building primarily on the latter.

## Open Textbooks

Apart from websites offering or listing individual textbooks by subject and level (e.g., the Open Textbook Library [<https://open.umn.edu/opentextbooks/>]), it is worth mentioning the existence of platforms specifically designed to support the authoring, release, remix, and creation of derivative versions of open textbooks and, more generally, open books.

**Pressbooks** [<https://pressbooks.org>] and **Manifold** [<https://manifoldapp.org>] are two examples of platforms specifically designed to author, enrich with multimedia content, and share textbooks (open or otherwise), which can be read online and exported in multiple formats. Despite being initiated in North America, and with institutions making use of both platforms primarily in Canada and the USA, universities from other continents have started to work with these platforms.

## Wikimedia

Launched in 2001, **Wikipedia** has now more than six million articles in English and many over 300 different languages. While it cannot be treated as a scholarly or even a reliable resource, as an OER infrastructure it has enormous value for active learning and outreach in HE (Petrucco and Ferranti 2020; Poulter and Sheppard 2020). While the infrastructure of Wikipedia and its sibling platforms is maintained by the Wikimedia Foundation, they rely on a global community of volunteers, and there are Wikimedia chapters established as independent charitable organizations in many countries.

## National, Regional, and Institutional Actors and Infrastructures

### Africa

Several regional and national OER infrastructures have been established over the last decades in Africa, especially in the sub-Saharan area. It is worth noting the international dimension of various initiatives that pool together contributions from different countries, most notably OER Africa [<https://oerafrica.org/>] and the African Virtual University [<https://oer.avu.org/>] in HE (both have been affiliated with the OCW Consortium) and Teacher Education in Sub-Saharan Africa (TESSA) [<https://www.tessafrica.net>] in relation to schools.

The three initiatives include ROER with a regional scope that include partner institutions in multiple African countries and count with the support from different organizations: the William and Flora Hewlett Foundation (USA) in the case of OER Africa (initiated in 2008), The Open University (UK) for the TESSA project (launched in 2010), and the African Development Bank for the African Virtual University (initiated in 2011). Likewise, there are some examples of sizable institutional initiatives for HE in that area, such as the National Open University of Nigeria's OCW site (launched in 2010, but no longer active) or the OpenUCT of University of Cape Town in South Africa.

Regarding the north of Africa, it is worth mentioning the case of Morocco, where a national OER Declaration was launched in 2016 and some institutions have established their own institutional initiatives aimed at sharing educational resources and offering MOOCs (Zaatri et al. 2020). There is also a recent national initiative in Morocco, launched in 2019 with French support, known as Maroc Université Numérique [<https://www.mun.ma/>] that offers MOOCs provided by various Moroccan universities for HE.

## Asia

In Asia, most of the national or regional OER infrastructures are developed, maintained, and funded by governmental sources, except from Japan.

National MOOC platforms are especially popular in the eastern region of Asia (China, Japan, South Korea) (Marín et al. 2020a). In China, MOOCs are the most prominent OER format (“top- or high-quality open courses” or “state-benchmarking open courses”) (Yijun et al. 2020), many as academia-industry collaborations. Two examples of MOOC platforms are the China Open Resources for Education (CORE, launched in 2003, discontinued) and the Chinese MOOC platform Chinese University MOOC (CUM) [<https://www.icourse163.com/>] (launched in 2013). In South Korea, the KOCW [<http://www.kocw.net/home/index.do>] (launched in 2009) and the K-MOOC platform [<http://www.kmooc.kr/>] (launched in 2015) are the national platforms for OpenCourseWare and MOOCs, respectively. Similarly, Japan has its national OpenCourseWare (Japan OCW, launched in 2003, discontinued) and MOOC platform (JMOOC [<https://www.jmooc.jp/>], launched in 2013) but are maintained by a membership-based consortium of HE institutions (and businesses, in the case of the JMOOC), instead of governmental organizations, which is the case for China and South Korea. All these platforms focus especially on HE, CE, and LL. On the other hand, ROER seem to be well represented in India for HE and schools (Dhanarajan and Porter 2013; Ganapathi 2018). Concretely, eGyanKosh [<http://www.egyankosh.ac.in/>] was developed in 2005 by the Indira Gandhi National Open University for HE, and the National Repository of OER [<https://nroer.gov.in>] was developed in 2013 by the Indian government for schools.

## Middle East

Edraak [<https://www.edraak.org/>] is a nonprofit MOOC platform launched in 2013 based in Jordan but targeted at the whole Arab-speaking world for schools and CE (Wimpenny et al. 2016). Several institutional MOOC platforms in Turkey (e.g., AKADEMA by Anadolu University or Atademix by Erzurum Atatürk University) (Marín et al. 2020a) and the discontinued Turkish HE ROER initiative, which started in 2007 “National Open Course Materials” (Tisoglu et al. 2020), are relevant examples too. The YOK Dersleri Platform [<https://yokdersleri.yok.gov.tr>] stands out for being created as a reaction to the COVID-19 emergency in 2020 by the HE Council to offer HE courses and materials.

## Europe

Europe has been one of the most important players in promoting OER worldwide. The EU has created a framework to support HE institution in opening up education (dos Santos et al. 2016), and several countries have developed a full range of initiatives, some of which have been discontinued revealing sustainability issues (e.g., Jorum, Open Education Europe) (see Fig. 2). This is a key challenge affecting OER infrastructures, common to other continents, that will be discussed later.

Many of the ROER from Europe are institutional, especially based on HE institutions. Also, it is characteristic that some countries include province- or state-based infrastructures; this is the case for Germany (Marín et al. 2020b). Some national infrastructures have expanded their influence within and even beyond Europe. For instance, MiriadaX was launched in Spain but quickly became a quick infrastructure in Iberoamerican countries. Likewise, FutureLearn started in

**Fig. 2** Examples of national and regional digital infrastructures in Europe. (Note: The original figure of the Europe map was created by Commons user Alexrk2, CC BY-SA 3.0, shared via Wikimedia Commons). To see the figure in high resolution, see <https://doi.org/10.5281/zenodo.6352308>

the UK but is currently used in many other countries to offer their own MOOCs, such as HE institutions from Australia or the Netherlands.

### North America

North America has played a central role in the rise and expansion of the OER movement, with many pioneering initiatives and funding bodies concerned with OER in that region, most notably in the USA and Canada. The MIT sparked a global wave of interest on OER through OCW (with the OCW MIT [[www.ocw.mit.edu](http://www.ocw.mit.edu)], created in 2001), and then various US-based platforms put xMOOCs under the spotlight (e.g., Udemy since 2010: [<https://www.udemy.com>] or Udacity since 2011 [<https://www.udacity.com>], both with a focus on vocational courses), while Canada-based initiatives promoted more cMOOCs.

Despite its global reach, the largest OER, Wikipedia, extensively relies on the US-based Wikimedia Foundation. The USA has also led the way in terms of OER-based credit-bearing courses recognized across colleges, through initiatives such as the Saylor Academy [<https://Saylor.org>] (created in 2008), and in promoting the creation and adoption of open textbooks, through initiatives such as OpenStax [<https://openstax.org/>] (launched in 2012) and LibreTexts.

Although most efforts have been focused on HE, initiatives such as Khan Academy [<https://www.khanacademy.org/>] (created in 2008) cover the pre-K12 and K12 curriculum.

Education in Canada is governed at a provincial or territorial level, and there are various provincial open education initiatives. BC Campus OpenEd [<https://open.bccampus.ca/>] in British Columbia is one of the best known among those initiatives since 2011 in HE and LL, with a special focus recently on open textbooks. In addition, as mentioned before in global infrastructures, the first MOOC was organized at Manitoba University in 2008 and resulted in the definition of the model of connectivist MOOCs that has been then adapted by many other institutions worldwide.

Sometimes the USA and Canada are approached as a single region, such as in the case of WikiEducation [<https://wikiedu.org/>], which supports the adoption of Wikipedia for teaching and learning in HE with a special focus on these two countries, established as spin-off of Wikimedia 2013.

In the case of Mexico, a few institutions joined the OCW Consortium, and some launched their own OCW sites, namely, the Universidad de Monterrey and the Tecnológico de Monterrey. However, neither of the two websites are currently online. A current Mexican MOOC platform is the Plataforma Abierta de Innovación edX [<https://www.aprendoencasa.plai.mx/edx>] developed by the State Government of Jalisco in 2019 that provides access to a selection of international edX courses with the possibility of certification (CE, LL).

### South America

According to Hodgkinson-Williams and Arinto (2017), with the exception of Brazil, open education is still in its infancy in South America, and the debate around the adoption of OER is incipient, especially in countries like Chile or Guatemala.

However, the open education community in the continent is active and counts with several organizations that promote OER in the region, such as: OE LATAM [<https://www.oelatam.org/>], a regional node of the open education consortium OE GLOBAL; the Mercosur network for accessibility and collaborative generation of OER (REMAR); or EDUTEKA, Colombian initiative for schools and lifelong learning developed by the Foundation Gabriel Piedrahita Uribe and the School of Educational Sciences of the University of Icesi [<https://eduteka.icesi.edu.co/>].

Some countries have specific national and institutional policies related to open education in the context of HE (e.g., Colombia, Uruguay). There are a few institutional ROER in HE (e.g., Universidad Nacional de Costa Rica), while some OER initiatives have now been discontinued (e.g., Universidad Técnica Particular de Loja's OCW for HE in Ecuador or the Center for Distance HE of the State of Rio de Janeiro, a consortium of the six public universities of Rio de Janeiro funded by the state government of the city) (dos Santos et al. 2012).

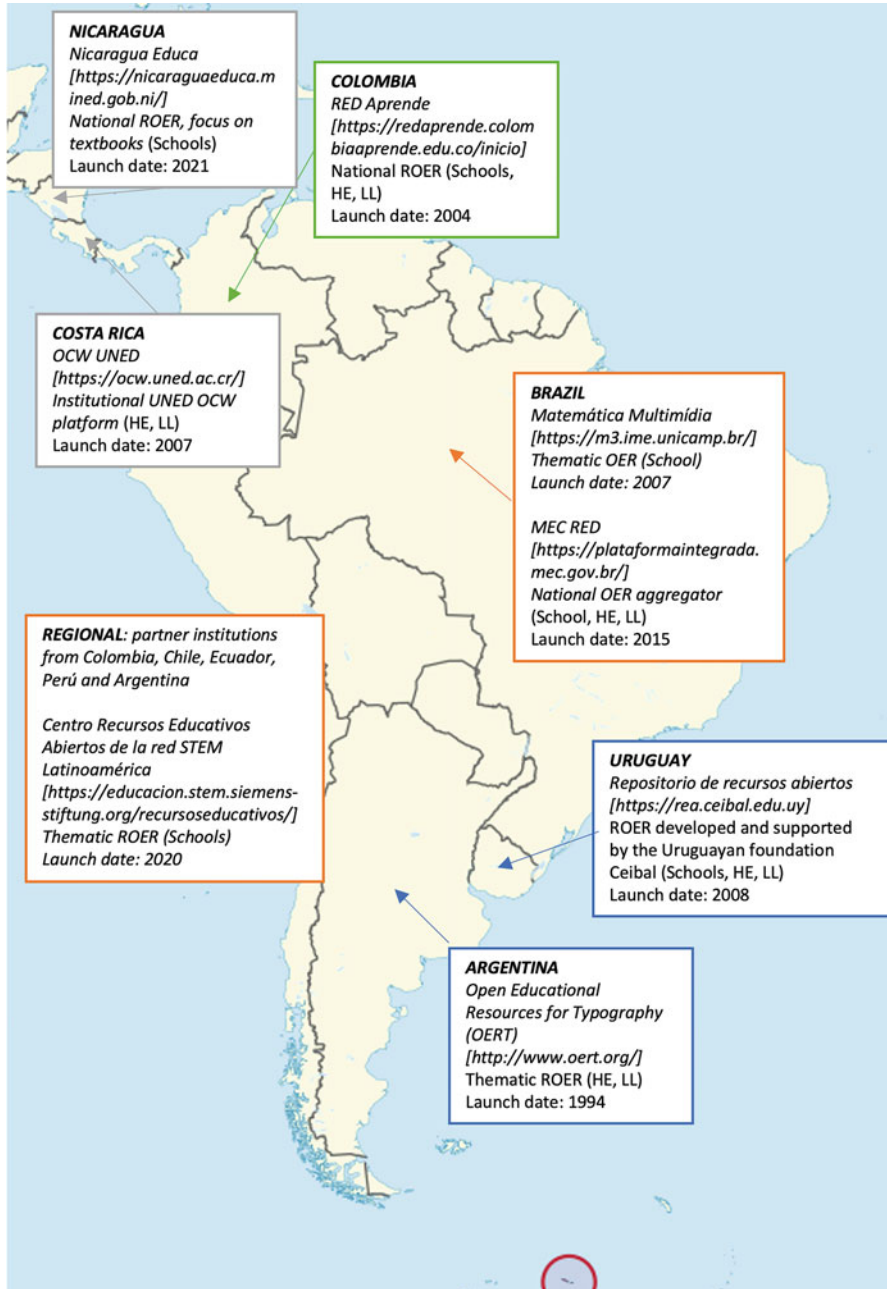

The Universidad de la República (Uruguay) is one of the most important players in the continent in promoting OER. Apart from having a program of virtual learning environments (ProEVA) that promotes OER and OEP and a research and innovation strand on accessible OER (Núcleo REAA), it has also engaged in different EU-funded OER projects in this field (Hodgkinson-Williams and Arinto 2017).

It is worth highlighting that the interest of OER infrastructures in this area is remarkably stronger in schools than other educational stages, which is in contrast with other continents and reflects the need to provide educational opportunities to every child, also in rural areas (see Fig. 3).

## Oceania

Most of the activity in the field of OER is linked to the OER Foundation and Otago Polytechnic, which hosts a UNESCO-ICDE Chair in OER and is behind the National Centre for Open Education Practice [<https://coep.nz/>]. This center was established by Otago Polytechnic and the Ara Institute of Canterbury in 2019 to provide leadership, networking, and support on OER and OEP adoption to HE institutions and practitioners in New Zealand. The OER Foundation – established in New Zealand but reaching global scope through OERu and WikiEducator – has channelled much of the activity in relation to OER infrastructures in this region.

In the case of Australia, various universities have now launched institutional OER initiatives, mainly MOOCs and ROER, despite the lack of support from the federal government in terms of funding or policy aimed at fostering OER infrastructures and practice (Stagg et al. 2018). For instance, the University of Tasmania has a MOOC thematic platform on dementia [<https://mooc.utas.edu.au/>], and the Swinburne University of Technology has its ROER for digital media and also hosts the Swinburne History and Art Collections [<https://commons.swinburne.edu.au/>]. There is also some interuniversity collaboration in this field, as shown by the Open Textbook Initiative for HE established in 2018 by five Australian HEIs [<https://emedia.rmit.edu.au/oer/>], and the funding of the National Centre for Student Equity in HE is providing for Australian Open Textbooks as Social Justice Project by Deakin University.

**Fig. 3** Examples of national and regional digital infrastructures in South America. (Note: The original figure of the South America map was created by TUBS, CC BY-SA 3.0, shared via Wikimedia Commons). To see the figure in high resolution, see <https://doi.org/10.5281/zenodo.6352308>

## Challenges and Future Research

The OER infrastructure scene offers many challenges and open questions, which also point towards directions for future research.

One of the most common challenges is the lack of awareness, including knowing that OER infrastructures exist and understanding the concept and its purpose, which has been identified – along with the lack of incentives – as a major barrier to engagement with OER (Baas et al. 2019; Bates et al. 2007).

The absence or non-systematic use of metadata and inaccurate labelling, especially regarding pedagogical/educational metadata, is one of the problems that makes searchability and findability of OER difficult, especially in the case of repositories (de Deus and Barbosa 2020; Rodes-Paragarino et al. 2016; Santos-Hermosa et al. 2017).

More generally, quality assurance has always been a major issue in OER infrastructures, a topic addressed by several authors (Atenas and Havemann 2014; Bates et al. 2007; Camilleri et al. 2014; Clements et al. 2015). Users' concerns about quality of content stored in OER infrastructures is a common aspect across the literature related to the topic too (Bates et al. 2007).

The sociotechnical, pedagogical, and cultural aspects of OER infrastructures and their adoption in different contexts are also an important topic, as suggested by both the examples presented here and the literature (Rodes-Paragarino et al. 2016). Cultural differences and preference for locally produced courses underline the importance of developing localized content and having situated OER initiatives (Cachia et al. 2020; Hatakka 2009; Rodes-Paragarino et al. 2016; Ruipérez-Valiente et al. 2020).

While OER infrastructures generally aspire to achieve a global reach, Global North perspectives and content produced in English are dominating the scene and creating considerable cultural biases and imbalances. That is the case even for truly global initiatives where contributions from anyone are welcome, such as Wikipedia. Despite this, Wikimedia editors, as in other OER communities happens, are largely skewed towards white, male, Western populations, which has resulted in a number of biases affecting the topics and perspectives included in Wikipedia and the rest of the projects (Konieczny and Klein 2018).

Related to this geographical issue, most of the OER research so far and many infrastructures have been developed in Europe and North America, by and for HE (Santos-Hermosa et al. 2017); hence, there is also room for improvement in this sense. Scarce research and infrastructures could be found for schools (with exception from South America) and even none specific for VE. Future research should include more voices from the Global South and cover other educational stages different from HE.

Licensing choices is also a contentious topic, with some purist voices claiming that any resources that do not comply with the 5-Rs principle should not be regarded as OER, while others – including the most recent definition recognized by UNESCO – consider that licenses preventing commercial uses or derivative works are equally valid for the release of OER. This creates situations such as the one presented by the

platform TED Talks, which publishes their videos under the Creative Commons BY-NC-ND license for personal use for free, but other types of use within an organization (e.g., for training) require a license for a fee (TED Conferences, LLC n.d.). At the same time, the OER status of some MOOCs platforms such as Coursera or Udacity has been questioned due to not using open licenses (Stracke et al. 2019).

Finally, the sustainability of OER and their infrastructures is a clear challenge to the continuity of initiatives (Orr et al. 2015) – as shown by some of the national, regional, and institutional cases discussed here – and there is not a single business model that may work in every context. For example, the decision to not continue the UKOER program (2009–2012) and the subsequent retirement of the UK OER national repository (Jorum) implied a shift from funding and responsibility at national level to individual institutions, favoring a devolved model where institutions have to find their own resources and meant optimizing resources by, for instance, including OER collections into open-access research repositories (Risquez et al. 2020).

Future research in the context of OER infrastructures should follow different directions, in addition to the ones already previously mentioned. Some research points towards learning analytics' practices to measure users' interactions with OER and interoperability between OER infrastructures (Yassine et al. 2016). Also, some authors have advocated for going a step further in establishing OER infrastructures and embracing OEP as the basis for a deeper pedagogical turn (Atenas and Havemann 2014).

---

## Conclusion

In this chapter an overview of the main OER infrastructures worldwide, and key challenges, has been provided. The landscape of OER infrastructures shows that there is still room for improvement through research in terms of sustainability, interoperability, users' awareness, quality assurance, licensing issues, and their socio-technical, pedagogical, and cultural aspects.

The Web gave rise to the emergence of e-learning as an academic field devoted to exploring and researching its use for teaching and learning, followed by a range of theories and approaches with their own flavors and terms, such as online learning, networked learning, and connected learning, while also forcing to redefine other established and more general concepts and fields such as distance learning, open education, or educational technology. The value of the Web in reconfiguring the way we share and access educational content has been demonstrated through successful OER infrastructures for some time now, but further research is needed to fully understand how to maximize its potential in different institutional, cultural, and social contexts.

Although technical issues related to the OER infrastructures are important for further developments, it is key to recognize that neither the use of digital resources for teaching and learning are uniform within or across countries nor are OER's

conceptions and perceptions the same in every context, and these aspects decisively influence the development and sustainability of OER infrastructures.

## Abstract

Considering the increase in the number of online courses and programs across the globe, preparing educators for creating inclusive online environments for learners to thrive is imperative. The worldwide pandemic of 2020, in a sense, only accelerated

A. Hedayati-Mehdiabadi (✉) · C. N. Gunawardena  
Organization, Information & Learning Sciences, University of New Mexico, Albuquerque, NM,  
USA  
e-mail: [ahedayati@unm.edu](mailto:ahedayati@unm.edu); [lani@unm.edu](mailto:lani@unm.edu)

the already rising trends of online course offerings in higher education and further expanded it to other sections of education and geographical locations. Reviewing the existing literature and building on the authors' experiences, this chapter uses a cultural and ethical lens to examine issues related to community and language to contribute to the design of equitable and inclusive online learning environments. Although these issues impact all segments of the educational enterprise, given the authors' experiences with adult learning, the focus in this chapter will be on adults as learners.

**Introduction**

One way to address the challenges and disparities highlighted during the worldwide pandemic of 2020 is to pay attention to issues of ethics and inclusion in education. In a sense, now, with thousands of courses going from face-to-face to online delivery, it might be the time to revisit how faculty and instructors around the globe can be supported to create a more equitable and inclusive space for students to prosper. Education is an empowering platform that can transform individuals and their communities. This chapter would help educators recognize and address underlying ethical issues that they might encounter online.

In this chapter, first, concepts including ethics and culture will be defined, and examples of ethical issues that might arise will be provided. The next sections are organized as follows: (1) community, where the question of "how social presence contributes to the relational dimension of online learning" will be explored, (2) ethics where some of the ethical issues of online education, including issues of power, silence, privacy and confidentiality, and accessibility, are explored, and (3) language where relevant concepts for creating a linguistically inclusive learning environment will be briefly discussed. The chapter concludes with implications for incorporating cultural inclusivity in designing learning experiences and future research.

---

**Concepts of Culture and Ethics in Online Learning Environments**

In examining culture, this chapter focuses on how culture influences online communication and learning. Ethical issues are often not very evident in online learning environments. However, they affect how learners and educators negotiate their communications and expectations online.

## Culture and Context

For this chapter, culture is defined as a “collection of shared perceptions of the world and our place in it. These values and beliefs affect both identity formation and societal roles. Each of us belongs to many tribes, and these memberships overlap sometimes in unexpected ways” (Gunawardena et al., 2019, p.3). The authors note that cultural affiliations can be considered broad or narrow. While national cultures can include millions of people, culture is also found at the regional, organizational, communal, and familial levels. Early studies that examined culture online (Uzuner, 2009) used Hofstede’s (1980) national cultural dimensions (i.e., power distance, individualism-collectivism, masculinity-femininity, uncertainty avoidance, and long-term orientation) to describe online cultures. But these bi-polar dimensional constructs can be limiting when applied to the online context. Ess (2009) provided a critique of the applicability of Hofstede’s framework to the online context and noted that what interests researchers is how national as well as other cultural identities, such as ethnicity, youth culture, and gender, interact with intercultural communication online. Therefore, defining culture from the national culture perspective, which is constantly changing, can lead to stereotyping. Cultures that emerge online transcend national culture, as culture online is negotiated by the interacting participants whose ethnic, gender, and religious identities are enacted, concealed, or merged into hybrid identities. Culture is experienced as part of a communication system of the interacting group where culture is developed through communication, dialoguing, sharing experiences, and interacting with each other.

Culture is generated from context and needs to be understood within context, and “context” refers to the setting or environment in which something exists. Hall (1959) made a distinction between high context (indirect) communication where many things are left unsaid, letting the context explain, and low context (direct) explicit communication. Hence, providing the context when messages are communicated online will reduce the chance of misunderstanding. Examining context further, Weissmann et al. (2019) observe that academic culture in the United States (US) tends to value “low-context” approaches to learning, for example, encouraging individual work, rigid schedules, faculty-oriented perspectives, subscribing to compartmentalized, and linear learning among other values. They noted that many women, underrepresented minorities, and bilingual students come from “high-context” cultures. They found communal work, flexibility in time, and nonlinear and contextual learning salient to their academic experience. Therefore, they advocate a shift in academia to “multicontext” perspectives that value context diversity to ensure inclusive learning environments. Multicontext theory suggests people are multicontextual (able to change and display flexibility across the cultural context spectrum) and have unique cultural identities and orientations (Ibarra, 2001).

## Cultural Inclusivity

With these conceptualizations of culture and context in mind, it is time to explore the question: What does it mean to be culturally inclusive in online design? A culturally inclusive learning environment must foster communication and community. Participants must feel a sense of belonging to a learning community, which values different beliefs, worldviews, and educational experiences (Gunawardena et al., 2019). Online courses that are individualized and designed without interaction with other learners or facilitators are not culturally inclusive learning environments. Cultural inclusivity moves beyond diversity. To be inclusive, diverse views must be heard, appreciated, and valued. Such an environment will help all learners feel welcome and appreciated for their unique perspectives and contributions. To develop a culturally inclusive learning environment, designers must encourage interaction and negotiation of meaning while at the same time anticipating the influence of their own, instructors,' and learners' cultural values and programming. Cultural inclusivity means understanding one's learners and learning from a cultural perspective, considering learning preferences, educational expectations, prior knowledge, past experiences, linguistic ability, and ...more.

## Ethics in Online Learning Environments

It has been argued that helping learners, which involves ethical issues, is at the center of instructional design and technology (Inouye et al., 2005). To position ethics at the center of education, Inouye et al. (2005) suggested changes in what educators know and do. Specifically, among other strategies, they discussed the importance of understanding context to be able to take proper actions and using learner-centered rather than instructor-centered approaches to teaching. Similar to Campbell et al. (2009) ideas regarding instructional design, morality in online education is not about right and wrong decisions. Rather, it is about the "importance of relationships in which mutual commitments are made, with integrity to enhance success – success in teaching, success in learning, success in service – success for positive social change" (Campbell et al., 2009, p. 646). Teaching in a digital era should go beyond offering courses in a technological format. In our view, the role of an educator is to build a community of engaged learners with empathy and care. From the existing ethical frameworks, ethics of care can be a good fit for discussing the ethics of online education, as several recent studies have argued for its promises (Rabin, 2021; Robinson et al., 2020). Ethics of care, also known as care ethics, is an ethical framework first introduced by Carol Gilligan (1982). It is a unique approach to moral theory that emphasizes responsibility and relationships over consequences (i.e., utilitarianism) or rules (i.e., deontology) (Nair, 2005). The use of ethics of care in online learning is not an intuitive task, as "the automation and standardization characterized by the online environment" (Rabin, 2021, p. 40) might seem antithetical to caring.

In this chapter, ethics of care has been used as a framework to look at ways online educators can create inclusive spaces for learners to prosper. The argument is that the

mere switch of the mode of delivery from face-to-face to online, without adjusting and customizing existing educational content and techniques to the learners' needs and situations, is not sufficient and is, in fact, against the principles of care. The literature on ethics of care in online education has been grounded in social presence as it focuses on understanding the relational dimension of learning in an online environment (Rabin, 2021). Social presence is an essential ingredient in an online community as it focuses on the relationships between online participants.

---

## Community

According to Watson (1998), community implies a basic connection to communication, and communication is a tool to create shared cultural meanings. "We should begin thinking of community as a product not of shared space, but of shared relationships among people" (Watson, 1998, p. 120). Community supports the social dimension of online learning and is the key recipe for an inclusive online learning environment. Building a culturally inclusive community is a gradual process that takes a collective effort from designers, facilitators, mentors, community experts, and participants. Several ingredients contribute to the community and a sense of community; "a feeling that members have of belonging, a feeling that members matter to one another and to the group" (McMillan & Chavis, 1986, p. 9). Among these ingredients, "social presence" takes the lead in helping educators focus on the relational dimension of an online community.

## Social Presence

Social presence contributes to a sense of community online, the feeling that one can connect with other participants. Social presence was defined as the degree to which a person is perceived as a "real person" in mediated communication (Short et al., 1976). Researchers have shown that social presence is a key ingredient of the social environment of online learning (Krejns et al., 2011; Richardson & Swan, 2003), a strong predictor of learner satisfaction in online environments (Gunawardena & Zittle, 1997), and a predictor of perceived learning in online courses (Richardson & Swan, 2003). Increased social presence, interaction, and collaborative learning among participants can support the development of each other's zones of proximal development (Whiteside, 2017).

Tu (2001) showed that engaging Chinese students in a more interactive online learning environment would increase social presence. These students perceived online communication as a more comfortable medium to express their thoughts due to lack of confrontation and face-saving concerns but were concerned that their messages may appear in public areas that may cause them to lose face and privacy. For Arab students, the lack of physical presence in the online environment was a positive feature because it provided a reduced risk of social embarrassment (Al-Harhi, 2005). In a study comparing online group process and group

development in the USA and Mexico, Gunawardena et al. (2001) found that US participants needed an increased level of social presence to connect with each other, while Mexican participants felt that having personal information about the participants was not so important. For Mexican participants, how their peers contribute to the discussion is far more important than knowing personal information about them. Many of these prior studies of culture online have used Hofstede's definitions of national culture as a framework to understand culture and have missed out on the interactions that happened between participants.

Approaching the online environment as one in which culture is generated by the interacting participants, Gunawardena et al. (2006) found that social presence played a key role in the communication patterns of chat users in their study of chat forums in Morocco and Sri Lanka. Properties associated with social presence in both cultural contexts included: self-disclosure, building trust, expression of identity, conflict resolution, interpretation of silence, and the innovation of language forms to generate immediacy. In developing an inclusive community, social presence is critical to building online connections and relationships as it impacts participation, interaction, trust, group cohesion, and social equality.

## Identity

Dennen and Burner (2017) observed that "Social presence and identity are closely intertwined" (p. 174), as identity (the sense of self) conveys the unique characteristics communicated by a person's presence. Identity in online learning environments involves both self and group identity. In their study of groups, Rogers and Lea (2005) found that social presence was enabled by emphasizing the shared social identity at the level of the collaborating group rather than the creation of interpersonal bonds between individual members of a group. Therefore, to develop a sense of community among group members, they recommend that identity online be "collectivized," reflecting the identity of the group rather than the individuals that make up the group. One technique that helps develop group identity is to allow groups to manage themselves, which will contribute to a shared group identity rather than prescribing roles and restrictive procedures for group members. Dennen and Burner (2017) observed that finding the appropriate balance of individual identity sharing and group identity creation remains an active topic of inquiry.

Therefore, when determining the appropriate level of social presence in an online environment, educators need to be mindful that participants have different perceptions of the degree of social presence necessary for online connections and interactions.

---

## Ethics of Care in a Learning Community

Research on ethics of care in online education has been grounded in social presence. Robinson et al. (2020) explored how online students describe being cared for. The authors suggested that strategies "such as proper training for online faculty with

explicit consideration to the affective/emotional element of online learning, timely communication with learners, and personalized feedback” (Robinson et al., 2020, p. 107) could help create an environment that makes students feel cared for.

Despite its importance, research on the ethics of instructional design and technology is limited (Moore & Ellsworth, 2014). Yusop and Correia (2012), critiquing the emphasis on approaches that neglect professionalism in preparing students in the field of instructional design and technology, argued the need for the formation of civic-minded instructional designers “who are both socially aware and technically competent in performing their job” (p. 180). In response to the lack of awareness of ethical issues, Gray and Boling (2016) analyzed the content of a selected number of instructional design cases to extract the ethical concerns of these cases (Gray & Boling, 2016). Lin (2007) conducted an empirical study to identify ethical issues experienced by instructional technologists and their coping mechanisms. This study identified six ethical issues, including (a) copyright, (b) privacy, (c) accessibility, (d) diversity, (e) conflicts of interest, and (f) professionalism/confidence to design quality courses. When asked about strategies to address these ethical issues, the participants of this study reported various coping mechanisms, including (a) team communication, (b) laws and policies, (c) management consultation, (d) professional integrity, and (e) technical solutions.

Teaching with empathy and care is at the core of an ethical approach to education in a digital era. Grounding in such aspiration, in the next section, some of the ethical issues of online education will be reviewed and discussed.

## Issues of Power

Closing the gaps related to power and access to resources among students from different backgrounds is imperative. Although communication technologies have the potential to equalize the playing field and enhance knowledge acquisition, they can be misused and widen the gaps that exist (Lin, 2007). This raises an important ethical issue for educators in online settings. Ethics of care provides a unique perspective on the issues of power. According to de la Bellacasa’s (2011) view, “care connotes attention and worry for those who can be harmed by an assemblage but whose voices are less valued, as are their concerns and need for care” (p. 92). Care ethics can expose how an understanding of needs might be twisted by people in power to maintain their positions (Tronto, 1993). Educators should be aware that no matter how hard they try, they may not fully understand their students’ situations. As stated by Tronto (2005), “It would seem that by putting oneself in the other’s situation, [the] distance can be overcome. But, . . . there is no way to guarantee that, in taking the place of the other, . . . the moral actor will recognize all of the relevant dimensions of the other’s situation” (p. 257). This emphasizes the importance of hearing students’ needs from their perspectives instead of making assumptions. As stated by Held (2006), “ethics of care advocates attention to particulars, appreciation of context, narrative understanding, and communication and dialogue in moral deliberation” (p. 158). Thus, teacher-centered online learning environments with little opportunity for interaction are not conducive to promoting ethics of care.

Rabin (2021) argued that issues of power in online settings “make understanding the cared-for’s needs complex” (p. 42). As stated by Covarrubias (2008), “as central bearers of power in our classrooms, we shoulder the sometimes difficult challenge of negotiating diverse interests, perspectives, and emotions on behalf of our students” (p. 247). Online educators have the ethical obligation to ensure learners are treated equitably. The first step is to review course materials, ensuring they are not offensive or exclusive (Lin, 2007). Similarly, stereotyping students based on age, race, and gender is another issue that can happen in online settings and needs to be recognized and avoided (Lin, 2007). Educators have the responsibility to reflect on their approaches to teaching so that they create an inclusive environment in which learners feel respected. Only in such an environment can students from different backgrounds engage in the course meaningfully.

Intercultural understanding is at the core of learning in today’s world (Morong & DesBiens, 2016). Effective intercultural learning involves a “direct experience of difference in supportive contexts” where participants are provided with a culturally safe environment and equal opportunities to engage in learning activities (p. 476). This is in line with “authentic caring,” a term coined by Valenzuela (1999). Rabin (2021) stated that such caring “requires transcending a false veneer of neutrality and equality to affirm students’ cultural, racial, and community identities and further their well-being beyond narrowly conceived academic achievement” (p. 40).

## Silence

Although individuals often focus on what is seen or spoken when thinking about cultural differences, culture is also expressed through silence; silence has different meanings in different cultures. Researchers have looked at the meaning of silence among students from diverse backgrounds, including Native American and Chinese students and its implications in educational settings (e.g., Covarrubias & Windchief, 2009; Liu, 2002). The difference in meanings and interpretations of silence has important implications for teaching and learning. Global educators should create inclusive environments that are sensitive to issues of silence and its meaning in different cultures.

Another related issue is what Covarrubias (2008) defined as discriminatory silence, which is “the withholding of voiced objections to statements that dismiss, disconfirm, or alienate a person because of racial, ethnic, or cultural origin when the ethical action would be to speak up” (p. 246). Online educators are ethically responsible for speaking up against discriminatory statements that might be made by participants in discussion forums or synchronous meetings. According to Covarrubias (2008), “unvoiced objections to them gave the persons to whom the statements were addressed the impression that the discriminatory statements had been disregarded, shrugged off, and dismissed” and lead to the promotion of an exclusionary learning environment (p. 242).

## Privacy and Confidentiality

Learners have the right to control their data. Technologies, if misused, can lead to the loss of control of personal data. One example of such a loss is the inappropriate use of learning management systems that keep learners' records. Another example is disseminating a student's work to future students without receiving proper permission.

Learner privacy was among the top ethical issues raised by participants (65%) in Lin's (2007) study. Examples provided by the participants included tracking students' activities using technology and the possibility of breaching students' privacy by sharing their postings in online discussion forums in conferences, etc., without obtaining proper permissions.

## Accessibility

Accessibility is another issue related to the ethics of educational technology (Lin, 2007). Removing barriers to help learners with disabilities access equitable educational opportunities is a critical component of an inclusive community. As Moore and Ellsworth (2014) discussed, accessibility is rooted in the notion of "barrier free design," which emerged in the 1950s in some countries, including the United States. While the focus on accessibility has traditionally been from a regulatory and compliance perspective, educators need to go beyond that to ensure equal access by focusing on the actual outcomes for learners (Moore & Ellsworth, 2014). This aligns with the ethics of care in which specific relationships with individuals, instead of general rules or principles, guide one's behavior. The discussion on accessibility in online education is about the learner-focused considerations that need to be taken into account by educators.

Some researchers in the field have used universal design to inform the practice of design for online learning (e.g., Pittman & Heislet, 2014; Rogers-Shaw et al., 2018). Universal design is "the theory and practice pertaining to design, development, and implementation of communication, information and technology products and services that are equally accessible to individuals who are both disabled and non-disabled" (Crow, 2006, p. 20). Universal design for learning (UDL) emphasizes accessibility, collaboration, and community (Rogers-Shaw et al., 2018). Rogers-Shaw et al. (2018) shared their teaching experience and suggestions on how to apply the principles of UDL to an existing course, including simplifying the syllabus, offering multiple ways of communication and representation, and providing various options for learners to show what they have learned. However, inclusivity should go beyond UDL to ensure all learners are valued and their perspectives heard. Careful attention to the unique needs of each learner helps create a learning environment, which is accessible to all learners.

## Language

### Language, Translanguaging, and Linguistic Inclusivity in Online Learning Environments

The Merriam-Webster dictionary defines language as “the words, their pronunciation, and the methods of combining them used and understood by a community.” Language reinforces cultural values, perspectives, and worldviews. Learners from oral cultures may not embrace the abstract discussions prevalent in Western discourse. Individuals from collectivist cultures may not feel comfortable providing critical comments in online discussions to avoid disagreement and maintain interpersonal harmony (Hu, 2005). Limiting the communications of an online course to text-based interactions negatively influences the richness of a learning experience and diverse ways of communication.

Using English as the international lingua franca instead of one’s native language leaves learners disadvantaged. Learners might have little to no opportunity to use English daily, and English might be a learner’s third or fourth language. Communicating in English requires non-English speakers to refer to dictionaries frequently. These learners might need additional time to read and reflect on reading materials and review other course content.

Another issue is that when non-native English speakers are present in a group, learners from dominant cultures (because of misconceived generalizations) may deauthorize these group members by assigning fewer responsibilities and therefore limit the learning experiences of non-native English-speaking members (Smith, 2005). Perceiving non-native speakers as “others,” in a sense, mirrors hierarchical structures within the society and creates an unsafe learning environment (Smith, 2005).

### Translanguaging and Communicating as Second-Language Speakers

Educational systems have long taken a monolingual orientation towards learning and forced learners to use the dominant language to make sense of the world (Makalela, 2015). However, through the recent shifts in technology and educational practices, the “monoglossic orientation towards language systems has lost space in the global, fluid and mobile communicative spaces” (Makalela, 2015, p. 16). Translanguaging techniques, by allowing more than one language, enable students to use more of their linguistic repertoire, assuring a deeper understanding of the knowledge (Fernández, 2019; Makalela, 2015). Using this approach, language becomes a resource rather than a barrier for meaning-making, specifically in contexts where learning the language is not the primary goal (Fernández, 2019).

Fernández (2019) suggested that translanguaging is a good strategy for culturally and linguistically diverse students to learn science as it contributes to equity. Another research confirmed that translanguaging within a dual language classroom increased opportunities for meaning-making for students as they could share the entirety of

their ideas (Hamman, 2018). In addition, conducting an ethnographic study of an adult English as a Second Language (ESL) program among Hispanic restaurant workers, Emerick et al. (2020) found that translanguaging is most powerful if it is viewed as a component of culturally sustaining pedagogy (CSP) rather than an independent strategy. CSP supports students “in sustaining the cultural and linguistic competence of their communities while simultaneously offering access to dominant cultural competence” (Paris, 2012, p. 95).

Despite the increasing interest in translanguaging as a learning strategy, it has not been sufficiently discussed in adult education or online settings. The number of studies on translanguaging in the context of adult education is limited (e.g., Emerick et al., 2020; Wilkins et al., 2014). This calls for more research on the effectiveness of using translanguaging strategies for educating adults. Moreover, the limited research on translanguaging in online settings has focused on teaching language online (e.g., Adinolfi & Astruc, 2017). More research is needed to explore and investigate the role translanguaging can play in online learning.

## Linguistic Inclusivity

Translanguaging promotes linguistic inclusivity in online courses and focuses on communication rather than language. Improving communication and improving fluency in a language are not one and the same. Communication involves more than fluency in a language; it consists of listening and sending a message that is understood for its intended meaning. Therefore, the question is how online learning facilitators can enable students to draw from their full linguistic repertoires relevant to the context of the communication and help them feel accepted and welcome in an online environment.

Another aspect of linguistic inclusivity that facilitators need to address is the use of nonstandard English in discussion forums. How can an educator provide positive feedback to students focusing on the meaning of the communication online rather than nonstandard English? In Fig. 1, we provide an example from a discussion on the definition of culture.

Linguistic inclusivity encourages the exchange of information, building on the full linguistic repertoires of learners. Linguistically inclusive learning environments are aware of how linguistic conventions in our disciplines reproduce inequitable social structures. Educators have an essential role in maintaining linguistic inclusivity and an equitable social environment.

---

## Recommendations for Inclusive Online Course Design

Drawing implications from our discussion, the following guidelines for inclusive online learning design are offered.

1. To develop an inclusive learning environment, engage in creating community and a sense of online community. Use greetings as a strategy to build

**Kate:** Thanks for your response Rita. I thought I could respond quicker than you, but I am late. This here is my response. When I think of culture I think of holidays. Though some of them don't have meaning, I not relate them to my culture. We celebrate Christmas, but it is different in my culture. It is quieter and less fancy. Do our holidays have to *be* a special meaning to be cultural?

**Rita:** Yeah, I get what you sayin because sometimes I look at all them fancy lights and think yeah back home we ain't never done nothing like that. My mama would say you got stock in the electric company girl?

***Initial Reaction Focused on Language***

Kate and Rita, it is important to remember that we need to use Standard English even if we are having a discussion online. It is difficult to decipher your meaning because of grammatical mistakes. Please review what you have written, edit it and post a meaningful response.

***A More Thoughtful Considered Reaction Focusing on the Ideas Expressed***

Kate and Rita, this is an excellent suggestion that holidays reflect culture. Yes, as you say the same holiday can be celebrated differently in different cultures. Your question is a good one. It is one we should consider as a group. Class, what do you think of this excellent question: Do holidays have to have a special meaning to be considered "cultural?"

**Fig. 1** Example of feedback focusing on communication and not the language

relationships and trust. Greetings and introductions that generate social presence, including a separate page that summarizes the community talents where members are invited to share stories or short videos, will enrich the sense of community. Be mindful of expressions of identity, difficulty in self-disclosure, and discomfort in posting photographs. For example, provide guidelines for self-introductions allowing a degree of anonymity, perhaps having participants introduce each other online rather than themselves. For those uncomfortable with posting photographs of themselves, provide the option to post a picture/image that represents them with the explanation of why and how it represents them. Design greetings that facilitate online connections and avoid greetings that might detract from an egalitarian/equitable learning community.

2. To encourage trust-building, consider small group activities that focus on hobbies or mutual interests in large classes during the orientation session or as part of precourse activities.
3. Moderators/facilitators/instructors play an important role in relationship building, creating community, and maintaining a safe and conducive environment for all participants, and therefore, should be present online frequently.
4. Synchronous sessions can increase the sense of community and social presence.
5. Paying attention to the context of learning and learners is an important element of care. Educators need to actively identify learners' needs, take responsibility and action to address those needs, and rely on the feedback they receive from learners to adjust and adapt.

6. As a facilitator/instructor, clearly communicate expectations for the online course (preferably in the syllabus) and demonstrate how these expectations might be different from face-to-face learning environments and prior expectations students may have had. Provide the opportunity to ask questions about class expectations. A useful initial activity might be to have participants ask questions about the syllabus in a discussion forum.
7. Diversify ways to participate – synchronous, asynchronous, video, audio, text, etc., and create opportunities for learners to choose among learning activities that enable different ways to communicate, process, and produce.
8. Interactions in online communities can sometimes lead to conflict and misunderstandings and, if left unresolved, can derail the work of a group. Gunawardena et al. (2019) recommend safeguarding against five counterproductive patterns: Devaluing a participant's perspectives or contributions, disrespecting beliefs or values, disrupting conversations or activities, disengaging from a collaborative learning experience, and deceiving community members by misrepresenting one's work or intentions. Therefore, establishing explicit community standards such as a charter is the first step to ensuring constructive communication and minimizing disputes. Participants should be encouraged to use e-mail to resolve misunderstandings and post mutually agreed-upon understanding for the group when conflict situations arise.
9. Develop Netiquette or communication protocols addressing issues such as language and discourse, including translanguaging and the use of Standard English. Recognize translanguaging is a normal practice for multilingual people. Allowing for an element of multilingual communication and diversity in the expression of English will promote cross-cultural understanding and a comfort zone in online communication. Context is essential to understanding messages, and therefore, participants should be encouraged to provide the context to enable the deciphering of messages communicated through an ephemeral and fluid medium.
10. Discriminatory language by participants needs to be confronted immediately. Include some guidelines in the Netiquette protocol or syllabus to prevent such comments. Such guidelines will also help you as an educator address the issue more easily if it arises by referring to those resources.

For an extended discussion of many of these techniques, including learner support and co-mentoring, see Gunawardena et al.'s (2019) framework "Wisdom Communities" (WisCom) for developing culturally inclusive online learning environments.

---

## Future Research and Directions

When a cultural perspective to research online learning is used, educators can be more attuned to the unique context and needs of learners who form the online community. Without such careful attention to the uniqueness of the learners and

their communities, empathy and care for learners, as required elements of ethical education, cannot be achieved. Therefore, it is imperative for future researchers to take a cultural perspective to conduct their research in online learning while attending to “the unique qualities and characteristics of individuals” and avoiding “simplistic stereotyping” (Jung & Gunawardena, 2014, p. 190). In this regard, an approach of “cultural humility” (Tervalon & Murray-Garcia, 1998), or “cultural humbleness,” rather than “cultural competence,” which includes self-reflection, self-critique, and self-evaluation, is preferred. Individuals can never really be culturally competent and may never get at the cultural nuances present in the contexts they interact, teach, and work. With this approach, the following future research areas for consideration are suggested:

- Exploring ways in which ethics of care is related to online learning outcomes, including learner satisfaction.
- Examining the meaning and the role of silence in online learning environments.
- Exploring ways to use translanguaging in adult education and examining its benefits in improving online learning outcomes.
- Analyzing issues of identity, gender, and language in online spaces.
- Studying how learners are transformed by their interactions and engagement with diverse online learners.
- Exploring how to collaborate and create in the next generation of digital learning environments.

### **Concluding Reflections: Striving for Excellence in Students’ Online Learning Experience**

Designing courses attentive to learners and their specific context and needs is an ethical issue. As stated by Woodley et al. (2017), “as educators and instructors of culturally and linguistically diverse students it is our responsibility to meet the needs of our students by using the best possible methods in curriculum and course design” (p. 477). In addition, as Morong and DesBiens (2016) argued, “in design for learning the focus shifts from instructional inputs to learner experience, activities, and what students actually learn” (p. 476). In the context of teacher education, Rabin and Smith (2013) stated that attending to care from a multicultural perspective and questioning one’s implicit assumptions are essential aspects to consider in preparing for caring relationships. The existing literature suggests that “engaged pedagogies, which highlights learner agency, group work and learning communities,” can better support learning among culturally diverse students (Morong & DesBiens, 2016, p. 476).

A digital environment can provide effective learning experiences only if the educator is familiar with the learning technology and its possibilities so they can design the course accordingly. As Lin (2007) discussed, possessing the credentials to create quality learning modules and courses using appropriate technologies is an ethical issue. An ethical course design in this context involves going beyond the

mindset of merely changing the delivery mode of a course. Instead, it should involve thoughtful reflection on the context, the subject, the learners, and the technology and how to best build on the strengths of the online platform and avoid the potential pitfalls while addressing specific needs of learners in a caring manner.

**Introduction**

This chapter explores the challenges and opportunities for expansion of open, distance, and digital education (ODDE) in the global south. The discussion begins by defining the terms as used in the chapter and explains why such approaches are of relevance to the diverse countries involved. The chapter provides examples of current practice in schooling and post-schooling contexts and how these practices have been adapted in response to external factors such as climate, financial, and pandemic crises. The chapter then discusses the challenges and opportunities indicated both by current practice and by current research into issues such as open pedagogy, technology-enabled learning, and educational financing. The discussion draws heavily on the experience of the Commonwealth of Learning (COL) in its efforts to support sustainable development through learning.

---

**Definitions**

The Commonwealth of Learning (COL) was established in 1987 by Commonwealth Heads of Government to promote the development and sharing of open learning and distance education knowledge, resources, and technologies. It is the world's only intergovernmental organization solely concerned with the promotion and development of open learning and distance education.

In an internal discussion document, COL defines open learning as an approach and distance education as a set of methods which can be combined as open (and) distance learning:

“Open and Distance Learning (ODL) is the provision of distance education opportunities in ways that seek to mitigate or remove barriers to access, such as finances, prior learning, age, social, work or family commitments, disability, incarceration or other such barriers.” (COL internal discussion document).

COL does not have a definition of digital education but has proactively promoted technology-enabled learning (TEL), which it defines as follows:

“Technology-enabled learning refers to the application of some form of digital technology to teaching and/or learning in an educational context to support and facilitate student learning.” (COL internal discussion document).

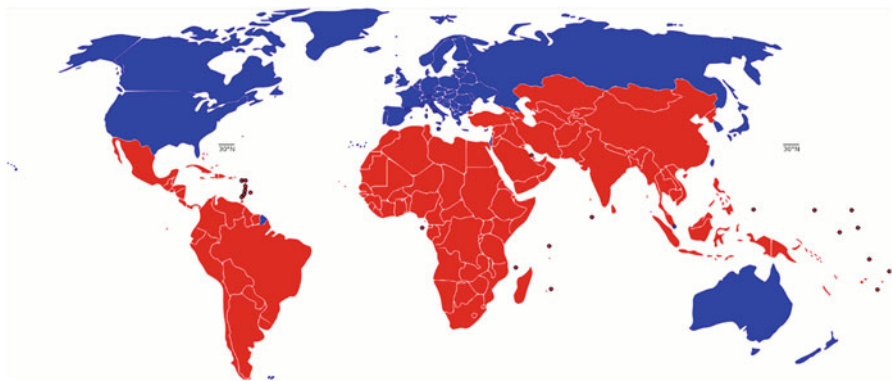

When the term open, distance, and digital education (ODDE) is used in this chapter, it is informed by the above understandings.

---

## Context

As Mahler (2017) and Clarke (2018) observe, the term “global south” may be interpreted variously. However, this discussion focuses on an understanding of the term as a mix of geographical, historical, and socioeconomic variables which typically challenge the dominant views and practices of the “global north” countries, many of whom were former colonial powers in the “global south” and whose influence is often still strongly felt. This discussion accordingly privileges the experiences and voices of countries indicated in red in Fig. 1 while also considering some of the key trends in the “global north” which influence practice in the global south.

As observed by the United Nations (n.d.), the world’s population continues to grow, with China and India accounting for 61% of the world’s population and with Africa being the fastest growing continent whose population is expected to double by 2050. However, as noted by the International Monetary Fund (2020), most of the countries in the global south are experiencing zero or negative real growth in gross domestic product (GDP). With an increasing population and decreasing GDP per capita, we can anticipate increased challenges for education provision, with the threat of overcrowded classrooms leading to lower retention, lower attainment and higher dropouts from schooling, and increasing numbers of not in employment nor in education and training youths unable to progress. As argued by Kanwar and Daniel (2020, p. 2), in response to the campus closures caused by the COVID-19 pandemic, governments should move from simply responding to challenges to developing more resilient education systems by “having open and distance learning

**Fig. 1** A geographic depiction of the global south (in red). (Source: By Kingj123 – Wikipedia; This file was derived from: BlankMap-World6.svg, Public Domain, <https://commons.wikimedia.org/w/index.php?curid=6603483>)

(ODL) arrangements in place.” Through appropriate ODL, or ODDE, provision, it is possible to increase access, success, and quality of educational opportunities in economically sustainable ways (Daniel, Kanwar, & Uvalić-Trumbić, 2009), but this does not necessarily mean going fully online (Hülsmann, 2016). There is evidence of a growing trend towards use of blended approaches which make use of digital and online learning complemented by some face-to-face contact.

---

## Examples of Practice

Bwalya and Hamaluba (2020) observe that ODL is well established in sub-Saharan Africa with examples of well-established open universities in Botswana, Nigeria, South Africa, Tanzania, and Zimbabwe and open schools in Malawi, Namibia, and Zambia, among others. Due to the wide range of contexts in which ODDE provision is needed, it is not uncommon to find different generations of provision (e.g., print-based correspondence, broadcast media, interactive ICT, and online learning) all being used simultaneously to address different needs in the same country. It is argued that some of the challenges for expanded ODDE provision include the limited investment in digitization, lack of appropriate policy frameworks, inadequate funding, limited skilled personnel, commercialization at the expense of public provision, and the high cost of hardware and the Internet as well as limited technical support. Some regions also lack agreement on a common language that would more easily enable provision to be scaled.

Reflecting on the provision of ODDE in Asia, Kharbanda (2020) notes that Asia in general has moved strongly into the digital realm, with growing use of open educational resources (OER) and massive open online courses (MOOCs). There are very large-scale examples of ODDE provision at both university and schooling levels in Asia, for example, over the last 5 years, the National Institute of Open Schooling in India has reached more than 3.5 million learners. Despite this, and despite impressive reductions in the number of out-of-school children at the end of the twentieth century, the trend in the reduction is leveling off, suggesting the need for expansion of ODDE provision at the schooling level if education for all is to be achieved.

In the Caribbean region, Samuels (2020) notes that the Caribbean Community (CARICOM), comprising 20 countries and representing about 16 million citizens, is a key role-player. Although all CARICOM members met the Millennium Development Goals for primary education provision, there was mixed success at the secondary level, and in 2012, the Caribbean Regional Policy Framework for Open and Distance Learning was developed to address this and other challenges experienced by the traditional education system. Many of the countries in the region offer curricula developed and examined by the Caribbean Examinations Council (CXC), which leads both curriculum development and reform processes and promotes the use of OER which can be adapted for context. Samuels also cautions that there is no one-size-fits-all model for ODDE provision noting that depending on context, after-hours face-to-face classes, blended, and online learning may all be appropriate. An

important post-schooling role-player in this region, the University of the West Indies not only has four campuses located in four different Caribbean countries but also has an open campus, and these facilities collectively cater for the needs of about 50,000 students.

In Latin America, Torres and Rama (2018) indicate that while distance higher education has been offered in many countries since the 1970s, its overall reach remains “marginal” (p. 5), although in the larger countries such as Argentina, Brazil, Colombia, Ecuador, and Mexico, distance provision was reaching 10–20% of students largely through the private sector offering technical and graduate programs. However, Romero (2021) observes that in response to the COVID-19 pandemic, there has been increased interest in exploring the potential of distance online learning, though access to the Internet and to devices varies widely between and within countries in the region and mitigates against widespread adoption.

In the Pacific region, Hollings and Naidu (2020) report that open education provision is well developed in New Zealand but less so in the smaller Pacific Island countries. For example, Te Kura was established more than one hundred years ago as the Correspondence School of New Zealand. More than 22,000 students are enrolled annually, including those who are enrolled at other state education providers and students beyond compulsory school age. In response to COVID-19, Te Kura made its content and a copy of its LMS, open to all secondary schools in New Zealand.

Along with nationwide delivery, another institution, the Open Polytechnic of New Zealand (OPNZ)’s approach to open learning and access includes maintaining a program portfolio designed to ensure entry points for all learners, irrespective of prior educational background. Fee-free work and life skills programs are offered at foundation and certificate level, and OPNZ’s learner base includes significant numbers of people who are unemployed and/or have no high school qualifications. The Polytechnic also delivers courses in prisons.

New Zealand is also the home base of the OERu, which is coordinated by the OER Foundation and provides free access to recognized university learning and affordable credentialing through its growing network of partner institutions.

Also at the higher education level, the University of the South Pacific is a unique regional university, owned by and serving 12 island nations of the southwest Pacific region: Cook Islands, Fiji, Kiribati, Marshall Islands, Nauru, Niue, Samoa, Solomon Islands, Tokelau, Tonga, Tuvalu, and Vanuatu. It has established an extensive ICT infrastructure and has used this to accelerate online provision in response to the closure of campuses due to the COVID-19 pandemic.

At a national level, the flexible, open, and distance education (FODE) division within the Ministry of Education in Papua New Guinea made use of a combination of digital resources, tablets, and limited physically distanced face-to-face contact sessions at decentralized centers to try to ensure continuity of provision during the pandemic.

In Vanuatu, ODDE is being explored to support open schooling provision. The geographically dispersed population (Vanuatu comprises an archipelago of some 83 islands) means it is not financially viable to offer traditional brick-and-mortar, face-to-face schooling for all learners.

---

## Insights from Research and Literature

Several recurring themes can be identified by an examination of the literature. It is worth noting that many of the issues currently being researched and debated in the literature related to online learning have also been the focus of research and discussion previously in the distance education literature, which covers a wider spectrum of provision.

---

## Diversity of ODDE Models

There is a growing diversity of possible distance and online learning and blended models like “flipped” classrooms (Fresen, 2018; Olelewe & Agomuo, 2016). Different tools may be used for different purposes and levels, but the trend is increasingly digital, connected, cloud-based, and mobile across diverse contexts, disciplines, and education levels (Firdhouse, 2016; Imhonopi, Urim, Onwumah, & Kasumu, 2017). In sub-Saharan Africa, for example, access to mobile phones has widely outpaced access to computers, and so mobile platforms like *M-Omulimisa* are now being used to support learning and development even in rural communities (Kalibwani, Kakuru, Carr, & Tenywa, 2021). There is increasing use of distance and blended approaches but also some recognition that decisions about how best to mediate learning must be based on some contextual understanding (Vaa, 2015). In the Caribbean, for example, open and innovative schooling provision has unfolded differently in the three countries with which COL has recently been working – Belize (where there is a high degree of decentralized autonomy and consequently different models being used in different communities by a variety of institutions and organizations), Guyana (where COL is working with the Adult Education Association to blend contact and online provision), and Trinidad and Tobago (where provision is increasingly moving online with the support of UNICEF).

---

## Policy Support

The need for policy to guide developments in a rapidly changing education environment has been long recognized as has the diverse ways in which policy may be understood. Specific policy guidelines are required for distance and online learning models in single, dual, mixed, and flexible modes of provision (Kanwar, Carr, Ortlieb, & Mohee, 2018; Naidu, 2017). One of the more interesting initiatives from a policy perspective is the Virtual University of Small States of the Commonwealth (VUSSC) which is a network of small states which collaborate to develop and share free content and which has developed a transnational qualifications framework to facilitate sharing of programs and recognition of credentials across national boundaries.

---

## Language

It has long been recognized that a key issue that needs to be addressed in all learning models is the language of learning and teaching. The more open the access, the more diverse the language learning support needs will be. In an African context, for example, it is likely that at the senior schooling and post-schooling levels, the language of learning and teaching will be a colonial language and not a local or home language. Therefore, the learning resource design team should ideally include people with expertise in supporting the teaching of speakers of other languages, supporting learners through the process of acquiring academic literacy in the target language of learning and teaching and working from an informed understanding of the extent to which schooling has prepared learners for learning in another language. In addition, reading on paper is not the same as reading on screen, and so new techniques may be required. It may be necessary to adopt strategies such as development of multilingual glossaries, multilingual captions for video materials, or even full translation of some resources into other languages, as well as the development of a related set of more general digital literacy skills (Daniels & Richards, 2017; de la Fuente & Comas-Quinn, 2016).

---

## Quality Assurance

Concerns about the maintenance (or improvement) of quality across different modes of provision (Abrahams & Witbooi, 2016; Council on Higher Education, 2014), in specific contexts (Raturi, 2016; Simui, Namangala, Tambulukani, & Ndhlovu, 2018), and across borders (AAOU, 2017; SADC, 2012) are shared concerns of both traditional distance and emerging online provision.

In similar vein, the more open the access, including access that transcends national borders, the more investment that will need to be made in program design, learning resource development, and learner and learning support if institutions are to ensure a quality learning experience for all learners offering a reasonable chance of turning access into success. This requires both a pedagogic (AAOU, 2017; Amory, Bialobrzeska, & Welch, 2018) and an agile regulatory perspective (CHE, 2014; UNESCO, 2005). Increasingly, student satisfaction will be a key indicator for judging quality as students progressively take greater control of their own learning (Chen & Yao, 2016; Tufue-Dolgoy, Vaai, & Suaali'I, 2016). As noted above, CXC, OERu, and VUSCC all provide examples of models which might be considered for assuring quality across multiple institutions and countries.

---

## Assessment

In both traditional distance education and more recent online provision, assessment plays a critical role, with a strong emphasis on its formative function in recognizing prior learning and in providing feedback both on student achievement and also on

how students can improve on authentic assessment tasks mediated in authentic ways using a variety of tools (Franklin, Li, & Jamieson, 2015; Ng, 2016). Many of the guidelines for good practice in assessment of older forms of distance provision equally well apply for online provision, but of course the growing use of technology also opens opportunities for new approaches and tools for assessment as well.

Ethical and constructive tracking of student online engagement and achievement, including checking of authenticity, should make it possible to provide critical, targeted, and personalized feedback, although the assessment of student online activity requires a credible set of metrics to be established first (Kim, Huang, & Emery, 2016; Zhou, 2015).

---

## Continuous Professional Development

It seems clear also that there is a need for significant investment and support to help teachers manage and use appropriate technology to mediate learning and then to use information from student engagement and achievement to improve practice (Hennessy, Haßler, & Hofman, 2015; Macharia & Pelser, 2013). Careful consideration must also be taken about changes to staff working conditions, workload, and remuneration in moving between modes of provision (Gregory & Lodge, 2015; Kennedy, Laurillard, Horan, & Charlton, 2015) as well as the impact on students and the support that they might need (OECD, 2015).

Digital technologies may allow more flexible learning student-centered learning, as well as opportunities to learn in very different spaces, when designed for use in these ways, thus blurring the boundary between physical and virtual presence on the part of teachers and encouraging more collaborative and cooperative approaches (Orr et al., 2020).

However, Trotter and Hodgkinson-Williams (2020) observe that while there is growing use of OER by both teachers and learners, the possibilities for inclusive co-creation and collaboration in the adaptation and creation of OER, along a continuum of access, participation, and empowerment, are currently more often seen among higher education teachers than learners and much less so at the schooling level. In addition, much OER that is available and being shared and used is in English, whereas it is estimated that there are some 7,102 living languages in the world with the global south being particularly rich in languages with an estimated 2,301 in Asia and 2,138 in Africa alone (Noack & Gamio, 2015).

---

## Finance and Sustainability

All the above issues raise questions about how education provision should be financed, and the relative contributions of individuals, the state and institutions themselves in this regard (Murangi, 2020).

Notwithstanding reservations raised by Kanuka and Brooks (2010) that when using technology we may achieve any two of improved access, quality, and

cost-savings but not all three concurrently, two experts in the field of financing distance education suggest that it should still be possible to scale the use of ICTs; for example, Rumble (2012, p. 41) notes: “The most important finding is that mass-media-based distance education could achieve economies of scale and could be designed so that the average cost per student (and to a lesser extent, because of higher dropout rates, per graduate) could be lower than similar costs found in face-to-face education.” Although having considered the matter, Hülsmann (2016, p. 37) concludes: “. . . in developing countries a combination of traditional mass-media-based instructional approaches with the intelligent use of mobile technologies appears to be more promising than imitating an online class model while having to increase class sizes to an extent that compromises the original instructional intentions of the model.”

---

## Open Questions and Direction for Future Research

While there is a clear potential for greater use of ODDE in the global south, there is a need for continuous research into contextualized lessons of experience in the following areas, among others, and the generation of appropriate new theory:

- Curriculum design, development, implementation, review, and improvement
  - How do we respond to continuously emerging learning and development needs in ways that ensure learning programs of quality that are both scalable and sustainable?
- Content/open educational resources (OER) development
  - How do we encourage greater use of OER and develop the skills of learners and teachers to find, adapt, and share back OER?
- Teacher training needs
  - What are the continuous professional development needs of teachers as they move into ODDE provision, and how can we address those needs at scale in ways that are both affordable and flexible?
- Manager training needs
  - As campus-based institutions migrate increasingly into blended learning and multi-mode ODDE provision, what are the training needs of managers, and how can we best support them?
- Technology-enabled learning
  - How do we keep abreast of the rapid developments in technology and ensure that learners, teachers, and managers all have access to the devices, connectivity, and skills training to maximize the potential of technology-enabled learning?
- Monitoring and evaluation
  - How well are we monitoring and evaluating ODDE provision and ensuring that we close the feedback loop into enhanced practice?
- Financing
  - What are the most appropriate ways to finance public education and enhance the offerings of the private sector and public-private partnerships?

- Gender equality
  - How do we ensure that ODDE provision helps us to reach the most marginalized learners and works towards attaining gender equality?
- Policies and models
  - What policies and models exist which might be used to inform increased engagement with ODDE provision?
- Quality assurance
  - With an increasing number of stakeholders offering increasingly flexible forms of ODDE, what quality assurance measures need to be in place? And how do we manage the tension between assuring quality and also being nimble to address constantly emerging needs in the most flexible and affordable ways?

---

## Implications for ODDE Practice

As observed in a recent COL briefing note (2020), to manage the COVID-19 pandemic, governments around the world were compelled to restrict travel and impose physical distancing norms. This meant finding alternative ways, using distance education methods, to ensure that school learning could continue without requiring teachers and learners to be in the same space at the same time. Even very remote learners can be reached via distance education. In the past, it has been used to reach children from the Australian outback to the Canadian prairies, and it currently supports millions of learners in Southern Asia and sub-Saharan Africa.

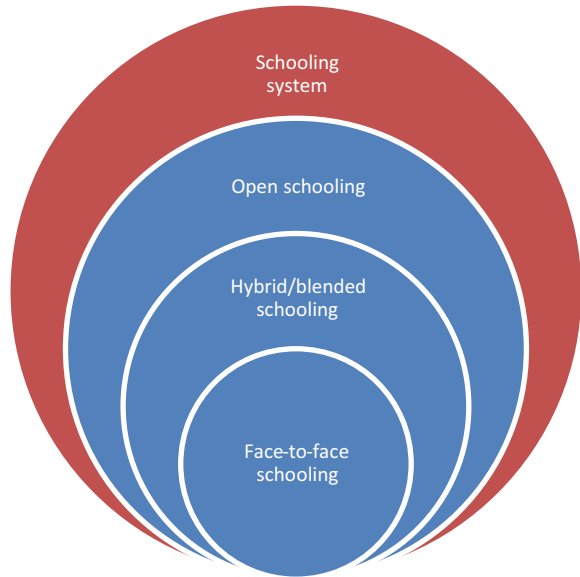

Developing approaches for more flexible provision of schooling opportunities can also help education systems meet the needs of numerous other learners who have been unable to access schooling, are in school but are not learning effectively, have dropped out of school, or need a second opportunity to improve their schooling outcomes to access employment or further education and training opportunities. Responding effectively to a short-term crisis can therefore help education systems develop more flexible and resilient approaches for the longer term, as illustrated in Fig. 2.

As illustrated in Fig. 2, face-to-face schooling will likely remain at the heart of the schooling system and is probably the preferred option for very young learners as well as learners with special educational needs that parents/caregivers may not be well equipped to address. However, hybrid (some face-to-face, some distance, some online, some broadcasting) and blended (face-to-face and online) provision could conceivably become the norm for older learners.

But for the approximately 300 million children unable to get to a physical school, an open schooling model, using ODDE approaches and methods, should be an essential element of an integrated schooling system.

It is possible that learners could move between models as needed. For example, learners attending face-to-face schooling who encounter certain barriers (e.g., ill health) might continue learning from home through distance learning; learners struggling with some subjects through distance learning might be integrated for a time into more structured blended or face-to-face learning.

**Fig. 2** A resilient schooling system (COL, 2020, p. 8)

As noted by Hollings and Naidu (2020, p. 243), however, learners who successfully complete schooling or schooling-equivalent programs through open and online learning will likely find new employment and educational opportunities open to them. In addition to obtaining a recognized qualification or credential, they will have developed the independent study skills and dispositions that make it more likely they will choose open and online learning for any further technical or vocational education and training or higher education they may pursue during their lifelong learning. So there is a need to extend ODDE provision at both further and higher education levels.

---

## Conclusion: Challenges and Opportunities

Although there is a clear potential for the expanded use of ODDE, there are several challenges. UNICEF (2020) notes that two in three children do not have Internet access at home, and those without such access are found in the lowest-income countries, mostly located in the global south. In addition, Internet data costs remain high relative to salaries in many global south countries, particularly in sub-Saharan Africa and the Pacific (Cable, 2021; Hülsmann, 2016). As noted previously, addressing challenges such as lack of guiding policies, limited funding (especially for digital infrastructure), limited technical support for educators, diverse language needs, and increasing commercialization requires a constructive partnership between the government and civil society partners. There is also a need for extensive investment in the continuing professional development of teachers (Mays, 2020).

However, the combination of digital technology, a more collaborative relationship between teachers and learners, and the ability to disseminate information quickly in support of change have certainly opened up new opportunities to support deep learning (Fullan & Langworthy, 2014) in affordable, scalable, and sustainable ways (Bates, 2018).

Contact programs, despite the often stringent conditions for entry, often experience very high failure and dropout rates in the first year but then subsequently tend to result in relatively high rates of retention and success (DHET, 2020). However, expansion of numbers in traditional contact provision requires expansion of facilities and staff, and hence costs, if quality is to be maintained. Appropriately designed and costed, ODDE provision can offer the potential to retain some of the cost-savings of provision at scale, by amortizing design and development costs over larger numbers while retaining some of the individual and group support processes that are associated with quality in more traditional contact provision (Hülsmann, 2016). The key issue would seem to be to find the right balance between real- or near-real-time human individualized support by institutional staff, creating the conditions for more peer collaboration and support than was ever possible in traditional distance provision and providing access to high-quality learning resources that maximize the potential for individual and peer learning. The issue to be explored, then, is how global south distance education providers are making informed choices about what teachers and managers do, what learners do, and what resources are made available in the online environment to balance the otherwise potentially competing concerns of access, quality, and cost.

As Mishra and Panda (2020) observe, technology has the potential to enable greater access to and success in learning, but it requires that we create appropriate national policy and development frameworks, that we learn from practice and that we continue to conduct research and evaluation into what works.

If we can ensure access to appropriate devices and Internet, we can use the new possibilities to work towards more open educational practices which provide training and support to staff in sharing their intellectual property and experience, making more constructive use of videos and discussion forums, and guiding and supporting learners towards self-regulation and engagement with authentic assessment tasks (Karunanayaka & Naidu, 2020).

## Abstract

Non-formal education contributes significantly to improve the literacy and livelihoods of individuals. Its significance becomes much more in developing countries where 70% of the world population lives. However, population densities, geographical diversities, and varied socioeconomic conditions in many developing countries make it difficult to offer need-based non-formal education (NFE) to all. Fortunately, open, distance, and digital education (ODDE) has emerged as a viable approach to offer quality non-formal education programs at a minimal cost. Research reveals that proper and effective use of ODDE to offer NFE changes the lives of many citizens in developing countries and may help these countries achieve the Sustainable Development Goals. This chapter presents in its first section an overview of the use of ODDE for supporting NFE initiatives in the developing world and identifies issues and challenges faced. The next section of the chapter outlines theoretical insights and findings of valued publications

**Introduction**

Over 85% of countries on this planet, with more than 70% of the world population, are developing countries. [The use of the term developing countries is in decline now, but continually growing economic disparities and resource divide among the world countries compelled us to stay with this nomenclature.] Citizens of the developed countries (15% of countries on the planet) enjoy better living conditions, affordable health services, ample job opportunities, good education, and advanced technological services, whereas citizens of the developing countries live in poor conditions, hardly afford basic health services, face growing unemployment, lack quality education, and constantly encounter the digital divide. Considering the challenges faced by the world, the global community adopted the Sustainable Development Goals (SDGs) in 2015. The SDGs are a collection of 17 interlinked global goals designed to achieve a better and more sustainable future for all. The SDGs recognize that ending poverty and other deprivations must go together with strategies that improve health and education, reduce inequality, and spur economic growth, all while tackling climate change and working to preserve our oceans and forests. The timeline to achieve SDGs is 2030. Following the commitment, governments across the globe are trying to achieve SDGs by 2030 (Misra, 2021; United Nations, 2021).

The success of SDGs is dependent on the implementation of developmental measures in developing countries, and education is a key to the success of SDGs (Vladimirovaa & Le Blanc, 2015). Providing need-based quality education to all citizens irrespective of their age or stage is the way to achieve SDGs and improve the status of a developed country. Research shows that the private return on investment in education is over 25% in primary education, followed by over 15% for secondary and higher education (Psacharopoulos & Patrinos, 2018). Recognizing the importance of education for development, providing quality education to all is a priority area for every government in the world. As a result, today, there is only about 13% illiterate population in the world. However, the bulk of this illiterate population is in developing countries (Roser & Ortiz-Ospina, 2018). In addition to making this vast population literate, providing educational opportunities to all, continuingly, is equally important for developing countries to develop sustainably. This is not possible through the use of formal education practices alone.

The formal education systems are usually the backbone for the development of a country. But non-formal education (NFE) also contributes significantly to improve the

literacy and livelihoods of individuals. Therefore, it becomes significant for developing countries to offer meaningful NFE opportunities to the citizens in addition to formal education. However, offering need-based NFE is a challenge in many developing countries due to the size of the population as well as many other geographical and economic conditions. Fortunately, many countries have started using open, distance, and digital education (ODDE) to make NFE more accessible and approachable to the masses. The assumption is that ODDE can offer quality educational programs at a minimal cost to the citizens that come from varied cultures, live in different geographies, speak multiple languages, and face economic inequalities. Proper and effective use of ODDE may change the lives of many citizens in developing countries and help these countries achieve SDGs. This chapter presents an overview of the use of ODDE for supporting NFE initiatives in the developing world and identifies issues and challenges faced. The chapter also reviews theoretical insights and major findings of key publications to further explore the use of ODDE for NFE. The final section provides the strategies for promoting NFE through ODDE in developing countries.

---

## Characteristics and Benefits of NFE

Like formal education (but unlike informal, incidental, or random learning), NFE is institutionalized, intentional, and planned by an education provider (UIS, 2012, p. 11). In a way, NFE is the mid approach between formal and informal education. NFE is more flexible than formal education in terms of rules, regulations, and certifications but more organized and goal-oriented in comparison with informal education. Khasnabis et al. (2010) observe that:

Non-formal education refers to education that occurs outside the formal school system. Non-formal education is often used interchangeably with terms such as community education, adult education, lifelong education and second-chance education. It refers to a wide range of educational initiatives in the community, ranging from home-based learning to government schemes and community initiatives. (para 1)

Usually, an individual's educational journey focuses on two approaches that complement each other: formal education and informal education. One attends schools and afterward higher education institutions to receive formal instruction. The successful completion of formal instruction is acknowledged in the form of degrees or diplomas. Simultaneous to formal education, an individual also learns from family, peers, and society. This education does not provide his/her any certificate or diploma, but the most valuable lessons to succeed in life. This education is named informal education. And the third type of education is NFE that supports or complements both formal and informal education. Assuming the image of education as a sandwich, then it will be appropriate to say that "formal education" forms its upper layer, "informal education" forms its lower layer, and "non-formal education" is the filling connecting both the layers. A report from UNESCO highlights the characteristic of NFE in the following words:

The defining characteristic of non-formal education is that it is an addition, alternative, and/or complement to formal education within the process of lifelong learning of individuals. It is often provided in order to guarantee the right of access to education for all. It caters to people of all ages but does not necessarily apply a continuous pathway structure; it may be short in duration and/or low-intensity; and it is typically provided in the form of short courses, workshops or seminars. Non-formal education mostly leads to qualifications that are not recognised as formal or equivalent to formal qualifications by the relevant national or sub-national education authorities or to no qualifications at all. Nevertheless, formal, recognised qualifications may be obtained through exclusive participation in specific non-formal education programmes; this often happens when the non-formal programme completes the competencies obtained in another context. (UIS, 2012, p. 11)

NFE has emerged as a tool that offers multiple possibilities and opportunities for individuals, societies, and countries, especially for the young and adult population. NFE caters to the needs of the society, especially those who are weaker sections of the society and may not have access to formal education due to a range of barriers including socioeconomic conditions. Explaining the utility of NFE for various user groups, a write-up from a working group on NFE of the Association for the Development of Education in Africa (2021) suggests:

Education will never be enjoyed by all without a wide variety of non-formal or 'non-school forms of provision: 'second chance' schools for children having passed the legal enrollment age; community schools for children in areas lacking formal provision; literacy and 'post-literacy programs for teenagers and adults; programs combining basic education with various forms of vocational training; and so on. (para 5)

Countries envision many benefits by offering need-based NFE opportunities for all. For example, NFE helps individuals to:

- Gain specific knowledge or skills
- Get learning and experiences in actual work settings
- Fulfil their personal, social, and professional development needs
- Improve or adapt their existing qualifications and skills
- Keep ready and updated for changing demands of jobs or industries
- Live an active, joyful, and productive life

There is a general principle that individual benefits collectively help societies and countries to develop socially, culturally, and economically. NFE works on similar principles and supports individuals to develop socially, culturally, and financially.

---

## **Mechanism to Deliver NFE**

As discussed earlier, the nature NFE depends on the need of the stakeholders. People usually opt for NFE due to five main reasons:

- Supplementing their formal education
- Compensating lack of formal education
- Increasing professional competence
- Having a desire for personal development
- Practicing a hobby or leisure activity

NFE is clubbed into four main categories. These categories are paranormal education, popular education, education for personal development, and professional training (Carron & Carr-Hill, 1991). Due to the advent of mobile communication technologies, people are also opting for NFE for popular and personal development reasons.

Several organizations and agencies provide NFE in developing countries. First among them are the governments. In Latin America and the Caribbean, Redvers-Lee (2002) found that governments are the key players in NFE. This observation is equally applicable for the majority of developing countries (Carron & Carr-Hill, 1991). Besides governments, other major providers of NFE in developing countries include educational institutions, non-governmental organizations, industrial houses, self-help groups, citizen forums, and international organizations. NFE is mainly provided in the form of short-term courses, training programs, seminars, and workshops. The duration of such programs ranges between a few months or weeks and few days. The training includes both theoretical and practical aspects and is facilitated by subject experts. At the end of the training, candidates are provided a certificate of successful completion or a certificate of attendance.

Increased literacy rates, higher gross enrolment ratios in the education sector, the changing demands of professions, changing requirements of the job market, and the desire to raise the financial and social status are significantly contributing to popularize NFE in developing countries. NFE has also emerged as a viable means to benefit from opportunities offered by liberalization, privatization, and globalization. As a fact, developing countries are relying heavily on NFE for achieving the SDGs. Summarizing the reasons behind the need and popularity of NFE, a report from a working group on NFE (Association for the Development of Education in Africa, 2021) states:

Non-formal education does not merely fill a gap. It also enables countries to consider their educational needs more holistically as they progress toward the goal of education for all. Moreover, non-formal education is better placed to meet the needs of disadvantaged groups and offers the advantage of being grounded in the workplace and the grassroots level. It can thus help to revitalize education [in Africa] by forging closer links between education and the realities of everyday life. (para 4)

While most of the NFE programs are organized at evening and weekend activities to accommodate the needs of the stakeholders, the time and location-dependent nature of the events are not normally suitable for many participants. Therefore, many governments and organizations are also using ODDE to offer NFE programs.

ODDE as a system of teaching and learning is a provision where the learners and teachers are quasi-permanently separated by space and time; there is an organization to facilitate the process of learning; use technical media (such as print, audio, video, digital technologies) for delivery of learning; provision of two-way communication (with assignments and online discussion); and occasional provision of the meeting of the participants to create and promote social learning (Keegan, 1996). It provides flexibility to the participants to join the learning opportunity from anywhere and learn at their own pace and time to accomplish their goal with limited requirements to join an in-person event. While the flexibility of ODDE offered the opportunity to many participants to join the programs, the increased number of participants also provided the “economies of scale” to the NFE providers to adopt this approach. In the past decades, the main changes for ODDE were on media and technology used for resources and delivery. Open and distance education started by using the print medium as a resource and subsequently added audio, video, and electronic resources. The delivery mode uses postal medium, radio, television, the Internet, and mobile as a mechanism to deliver ODDE. Nowadays, most providers use different resources and media in combination to offer ODDE.

ICTs have emerged as the backbone of ODDE for NFE. The NFE providers are now using ICTs, such as Internet-enabled computers and mobile phones, for instruction, resources, discussions, guidance, evaluation, and certification. The NFE providers advertise their courses online or on the institutional website or social media, admit students online, teach them online or in blended mode, ask them to submit their assignments online, examine them either online or offline, and also award certificates online. While there are also NFE distance learning provisions that are not facilitated by the use of ICTs, the ICT-supported versions offer a speedy, convenient, personalized, cost-effective, and cross-border supply of NFE. As observed by Latchem (2012):

Low-income and middle-income countries fully recognise the need to develop their human capital in order to develop sound market-based economies. NFE is a key feature in pursuing this goal. However, so great is the task that it cannot be achieved by conventional means alone. This is why applications of open and distance education and of information and communications technology (ICT) can play such a vital role. (p. 2)

The advocacy for using ODDE for NFE in developing countries is supported by many arguments. These arguments suggest that ODDE-supported programs and activities can be:

- Accessible to many learners residing in different localities
- A viable option for people with low or poor economic status
- Offered by any willing institution or organization or individual with minimal resources and facilities
- A cost-effective and economical way for learners to enhance their knowledge and competencies
- Helpful to cater the learning needs of youth and adult learners by reaching their doorsteps
- Used in combination with the formal system of education

## Examples of NFE Through ODDE

There are limited NFE provisions in developing nations (Latchem, 2014). However, the earliest report on the use of distance learning for NFE listed 73 projects in 56 developing and 17 industrialized countries (Dodds, 1996). Presenting a compilation of several case studies of NFE by distance and open learning, Siaciwena (2000) stated that distance learning demonstrates potential in enhancing the contribution of NFE to socioeconomic development, for example:

... the Zambia Radio Farm Forum programme enables the Ministry of Agriculture, Food and Fisheries to reach larger numbers of peasant farmers than is possible through other extension services. The Radio Farm Forum programme helps over 21,000 small-scale farmers/peasants in rural areas, who listen and participate in the programme, to learn new knowledge and develop new skills. In the Ghanaian case study, the use of radio strengthened the coverage, by the literacy programme, of the functional and developmental themes. Another important lesson is that distance learning approaches can be effective in changing people's attitudes/behaviour and in motivating rural communities to undertake action leading to the improvement of their socio-economic conditions. (p. 5)

In 2007, the Bangladesh Rural Advancement Committee (BRAC) came out with an interactive audio course to deliver information over mobile phones. Each course had a few points to convey, such as the importance of clinician-assisted birth or the dangers of indoor smoke. As an incentive to take the courses, there was a short quiz at the end of each call, and if the caller passed the quiz, free airtime was delivered to their mobile phone (InfoDev, 2010, p. 14). The BRAC experiment showed that with a vision, proper planning, and appropriate infrastructural support, ODDE-supported NFE can be a game-changer.

In India, the National Institute of Open Schooling (NIOS) offers several vocational education programs to meet the need for skilled and middle-level human resources working in both organized and unorganized sectors. The NIOS has expanded the range of vocational education courses over the years depending upon the needs of learners and market demands. In addition, vocational education courses of NIOS are for both urban and rural sectors. The success of NIOS in offering vocational education programs shows that ODDE-supported NFE can bring several social and economic gains (NIOS, 2021). NIOS also offers an open basic education program to increase the literacy rate in the country. Priyadarshini (2006) reported that the priority groups of this program include women, disadvantaged communities, daily wage earners living below the poverty line, rural persons, and those living in urban slums.

The UNESCO Institute for Lifelong Learning's database on literacy case studies reports the use of computer-based functional literacy in India by Tata Consultancy Services in nine languages. The adult literacy program uses a multimedia software package and e-Learning system to help adults speaking the native language without literacy skills to learn basic reading, writing, and arithmetic. Through this initiative, "The content is presented via a multimedia puppet show and focuses on individual words rather than the alphabet, with the aim of teaching learners to read and write 700 commonly used words in their native language" (Chatzigian, 2019).

The Alphanétisation de Base par Cellulaire (ABC) (en: Mobiles 4 Literacy) program in Niger uses mobile phones to promote adult literacy and numeracy. Reporting the case study, Hanemann (2017) states the project enhanced the reading and writing and math scores over time from zero to, on average, between two and three, meaning that learners could read and write sentences and complete addition and subtraction problems.

The Commonwealth of Learning (COL) has been promoting the use of distance learning for non-formal education since its establishment. COL's Lifelong Learning for Farmers (L3F) program has demonstrated huge success in the use of distance education and low-cost technologies in improving the lives of farmers in Asia and Africa. Rooted in the idea that cognitive social capital is a precondition for lifelong learning, the approach taken is to focus on the community for imparting training and use of radio and low-cost mobile phones alongside face-to-face meetings to provide functional literacy. A study in Africa reports members of L3F to have significantly higher empowerment scores than the non-L3F control groups and also have higher profits and profit efficiency in poultry farming, thereby significantly improving their livelihoods (Balasubramanian, Carr, Yindok, Atieno, & Onyango, 2014). Evaluating L3F in India, the National Institute of Bank Management reported that the program yielded a 9:1 financial return on the investment by COL, and the L3F community members have substantially high earnings than the non-L3F group (Kumar and Kulkarni, 2013).

ODDE provisions are not only effective in increasing access to learning opportunities for those who need education but are also cost-effective solutions for NFE. Arguing in favor of using ODDE for NFE, Latchem (2018) noted:

The developing countries experience great difficulty in funding the current forms of formal education and escalating access to equitable and quality non-formal education (NFE) by conventional means on the scale needed would cost many billions if not trillions of dollars. It is here that open and distance learning (ODL) can play a significant role by opening up access and lowering the costs by the use of alternative methods and information and communications technology (ICT). (p. vii)

In addition, Table 1 presents a summary of some key publications that the readers may find useful to further explore the use of ODDE for NFE.

---

## Issues and Challenges for NFE Through ODDE

While ODDE has the potential to increase access and reduce the cost of quality NFE in many countries, there are several concerns and challenges faced by developing countries regarding the provision of NFE to all willing citizens. Research reveals that the poor and least educated in the developing economies are unable to take benefit of NFE due to many barriers including situational barriers (those arising from one's situation in life), institutional barriers (practices and procedures that hinder participation), and dispositional barriers (attitudes and dispositions toward learning)

**Table 1** Insights from key publications for NFE through ODDE

Title of publication	Key insights
Latchem, C. (2018). <i>Open and distance non-formal education in developing countries</i> . Singapore: Springer	This comprehensive book with a development agenda is directly related to the topic of this chapter. Colin Latchem covers the topic of NFE to inspire the readers and inform policymakers and providers how distance learning has been successfully used. The book covers the use of radio, television, mobile learning, open educational resources, massive open online courses, and traditional performing arts, to design non-formal distance education. Several case studies are grouped under thematic areas such as out-of-school children and youth literacy, gender equality, adult learning, and language learning, persons with disabilities, agriculture, health care, and small and medium enterprises. This is a book for anyone interested in this field for an in-depth review
Latchem, C. (2014). Informal learning and non-formal education for development. <i>Journal of Learning for Development</i> , 1 (1). <a href="https://j14d.org/index.php/ejl4d/article/view/6/6">https://j14d.org/index.php/ejl4d/article/view/6/6</a>	This seminal work examines the issues of open, distance, and technology-based informal learning and NFE for individual and community development. Considering the significance of informal learning and NFE, it makes a case for more research and evaluation on the design, development, and application of appropriate methods, ICT, mass media, and traditional forms of communication for learning to lead to development
Latchem, C. (2012). <i>Quality assurance toolkit for open and distance non-formal education</i> . Vancouver: Commonwealth of Learning. <a href="http://oasis.col.org/handle/11599/106">http://oasis.col.org/handle/11599/106</a>	This publication explores quality assurance in NFE with an emphasis on the evaluation of their outcomes, outputs, and impacts. The publication examines approaches to quality assurance that are needed in NFE and introduces a rigorous but simple quality assurance framework. This is a definitive toolkit for anyone using ODDE for NFE
Siaciwena, R. (Ed.) (2000). <i>Case studies of non-formal education by distance and open learning</i> . Vancouver: Commonwealth of Learning. <a href="http://oasis.col.org/handle/11599/38">http://oasis.col.org/handle/11599/38</a>	This research report presents the use of a range of media such as print, audio, video, broadcast radio, and television for NFE in five African countries (Ghana, Kenya, Tanzania, Uganda, and Zambia). This report will be of interest to anyone involved in the planning, development, and implementation of NFE programs
Dodds, T. (1996). <i>The use of distance learning in non-formal education</i> . Vancouver: Commonwealth of Learning; Cambridge: International Extension College. <a href="http://oasis.col.org/handle/11599/253">http://oasis.col.org/handle/11599/253</a>	This report, one of the initial works in this field, documents the use of distance learning for non-formal education. This study reports 73 projects in 56 developing countries and 17 industrialized countries. The directory of the projects provides insights into early experiments and successes. The report also

(continued)

**Table 1** (continued)

Title of publication	Key insights
	notes that non-formal distance education projects are often poorly funded, which often leads to low quality, disappointing results, and lack of sustainability. The findings of this study are still relevant today

(Latchem, 2014; UNESCO, 2019). In addition, the following factors are also responsible for the less reach of NFE in developing countries.

**Social status of NFE:** Two decades earlier Perraton (2000) noted that distance learning NFE programs are regarded as second-class provisions for groups of low social standing and have little political influence. While COVID-19 has significantly changed the mindset about distance learning, the status of NFE has not changed much in the last two decades. There is a popular belief that NFE is practical and skill-based; hence, face-to-face or in-person teaching or instruction is best to get it. As a result, in-person NFE is still the first choice among the masses.

**Policy (political) support to NFE:** The education systems in developing countries, both formal and non-formal, are mainly devised and promoted by governments (popular political parties), which do not recognize the role of distance learning as a policy for promoting lifelong learning. Distance learning for NFE has been visualized as a series of pilots that never became institutionalized or taken seriously by governments (Dodds, 1996; Perraton, 2000). The governments across developing countries are promoting online learning and coming up with several projects. But these projects mainly focus on using online learning in the formal education sector rather than for the NFE sector. To make extensive use of ODDE in NFE, supportive policies and political support are needed. For example, in India, the open basic education program of the NIOS is recognized as equivalent to the formal school for purposes of higher education and employment (UIL, 2015).

**Inexperience among NFE providers to adopt ODDE:** NFE providers in developing countries have evolved their mechanism and methodology to offer the programs. The providers mainly use the experiences and expertise that they receive from the formal education sector. The providers rarely received training on how to use ODDE to provide NFE to the masses. There are limited training opportunities on distance learning for NFE. As a result, the NFE sector in developing countries still depends on the formal system of instruction.

**Marketing and publicity of NFE:** ODDE-supported NFE has its success stories, but unfortunately, these stories hardly become viral or reach the stakeholders (Latchem, 2018). These success stories remain confined to a particular sector or region. There is no agency to promote and publicize such success stories in other parts of the country or across countries. Nowadays, participants and providers are using online social media to promote such stories, but that is not enough. The other notable point is that the majority of the population in developing countries lives in rural areas and hardly watches such success stories on social media.

**Private players to promote NFE:** After the advent of globalization, private players are playing an active role in the formal education systems of developing countries. But private players are not active in the NFE sector. The cost structure of NFE and the paying capacities of the stakeholders to access NFE programs do not encourage the private players to work in this area. However, the emergence of technology-enabled NFE programs creates new opportunities for private players, non-governmental organizations, and philanthropic organizations to actively engage in this area to support development.

**Research on designing, delivering, and evaluating NFE:** Research plays a significant role in realizing the educational needs of individuals or society and accordingly designing and developing educational programs or activities. Research guides effective and efficient way to design and offer educational programs and informs whether offered programs or activities are working well or able to meet the expectations. Unfortunately, not much research is available on designing and delivering need-based NFE for the masses in developing countries. The evaluation studies on ongoing NFE initiatives are also missing or remain unreported. Needless to say, the absence of research on designing, delivering, and evaluating NFE is severely hampering the progress and prospects of NFE through ODDE in developing countries.

Besides, some other factors that affect the use of ODDE for NFE in developing countries are:

- The demands for offering NFE in local or regional languages
- The digital divide among NFE aspirants
- Hesitation to join NFE as adults
- Family- and work-related responsibilities of NFE aspirants
- Lack of guidance and counselling about the benefits of NFE
- The social mindset that blocks the road of NFE for women

In a nutshell, developing countries face several challenges to promote open, distance, and digital non-formal education. Therefore, it can be stated that to promote the use of ODDE for NFE, developing countries need specific strategies to implement ODDE in NFE contexts.

---

## **Strategies for Promoting Use of ODDE for NFE**

NFE in developing countries has been visualized and offered on the pattern of the formal education system. In reality, only a limited number of institutions or organizations offer NFE. The NFE programs are delivered on a set pattern, and both providers and takers have their reasons to celebrate. The providers feel happy to claim that they have offered so many programs, and participants feel jubilant to get a completion certificate to show. But the real intent behind offering NFE, i.e., bringing a change in the lives of participants by helping them to update their knowledge or skills, remains absent in such proceedings. To overcome such a situation, this

becomes the responsibility of governments, NFE providers, and all associated institutions to adopt innovative policies and practices for delivering quality distance learning for NFE at the doorsteps of the masses. We discuss some of the possible strategies that could be adopted by governments and NFE providers in developing countries.

**National policy:** National education policies are a regular feature in developing countries. These policies refer to NFE, but ODDE is hardly a part of the discourse in such policy documents. A well-thought and focused policy is a must for promoting any educational program or scheme. Realizing this necessity, the governments in developing countries need to adopt specific policies for distance learning operations of NFE opportunities. These policies can be made as per the need and ground realities of a particular country but must necessarily answer the following.

- What types of ODDE NFE programs will be delivered?
- Who is eligible to offer ODDE for NFE?
- What will be the terms and conditions for such providers of ODDE?
- How do NFE providers ensure the quality of ODDE programs?
- What will be the mechanisms for certification of ODDE NFE programs?
- How can providers of ODDE for NFE be accredited?
- What will be the legal framework for accepting ODDE for NFE within the national qualifications' framework for employment and other educational purposes?

Adopting a specific policy would help increase the visibility of ODDE for NFE programs and the acceptance of the pilot projects to become mainstream.

**National coordinating agency:** Multiple agencies provide NFE in developing countries. Unfortunately, all these agencies work in isolation. They only cater to their target groups and feel happy by achieving designated targets. Realizing the isolation among providers of NFE, developing countries must think of setting up a dedicated agency to coordinate and manage the NFE offerings. This is important if the economies of scale are to be leveraged to reduce the cost of operation and make ODDE a viable option for NFE. This coordinating agency may act as a one-stop shop for curriculum design and development of learning materials and guide the providers in the effective delivery of ODDE for NFE programs. This agency may also conduct training, ensure quality, and maintain data for the government to take policy decisions.

**Online portal for NFE:** Online services significantly improve good governance in the developing countries. Online portal helps the governments or concerned agencies to get real-time data and monitor the progress of different schemes or projects. A national portal for resources, expertise, and programs on ODDE for NFE could help improve access to information for all concerned. The governments can use this online portal for many purposes and in several ways. The providers can be allowed to use this platform for the complete cycle of ODDE (enrolment, instruction, examination, and certification). The resources on the portal could be made available as open educational resources to help reuse and remix to offer programs by several providers and contextualize the resources by translating these to local languages.

**Increase funding:** ODDE programs require an initial higher investment due to the preparation of learning materials and the use of technological systems. While the recurring costs are less, the initial fixed costs sometimes are deterrent for NFE providers to adopt ODDE, even when there is a high scalability of the program to reach enough participants for economies of scale. Thus, governments in developing countries must provide adequate funding support for NFE programs to adopt ODDE and become sustainable. While governments may take the bulk of such responsibility, the private sector and philanthropy could play a significant role in increasing the funding base for ODDE. Availability of increased funding support could help the development and offer more of NFE programs using ODDE in many different areas to reduce unemployment, speed up the economy, increase productivity, promote self-sufficiency, and achieve SDGs.

**Partnership and collaboration:** Providing NFE to every willing citizen is a mammoth task. Governments in developing countries alone cannot fund and run such programs. As indicated above, this calls for partnership with the private players to collaborate in developing joint programs and offer these on a large scale. In such partnership, the role of state-owned institutions will be to provide infrastructural facilities, and the private players will be responsible to run the program and offer instructional support. In addition, the governments may also offer several incentives to private players for offering NFE in less reached areas. Collaboration at the local level is vital for ODDE for NFE, as local partners would provide community-level support to reach many participants. Also, with the use of digital tools, it is important to have a partnership with Internet service providers and telecommunication providers to offer zero ratings of NFE platforms and portals and provide free SIMs and data access for learning.

**Marketing and publicity:** The ODDE for NFE is hardly a part of national discourse in developing countries. In the absence of any national policy, the ODDE options are considered largely an individual choice that is fulfilled by specific agencies working at selected places or regions. These success stories are not widely known to many people to attract their attention to the ODDE provisions. Therefore, it is important to create a system to document the success stories of using ODDE for NFE and its wide circulation in social media as well as mainstream media, including radio, television, and newspapers. In addition, there is a need for local community engagements in creating awareness about the advantages of ODDE, which is flexible and provides social learning opportunities and skill-building through limited in-person engagements.

**Employers' support:** The majority of the NFE aspirants in developing countries is either employed or would like to be employable. In other words, prospective participants see NFE as an opportunity to enhance their competencies and skills for improving their livelihoods. Therefore, it is important that NFE providers engage with industry and employers to develop and offer courses that could lead to employment and improve the livelihoods of the participants. The credibility of ODDE among stakeholders is necessary to create the cycle of confidence. Employer engagement in the design and development of ODDE programs would build their confidence in the participants completing the NFE programs.

**Training of NFE providers:** The majority of NFE providers in developing countries still rely on the traditional method of instruction, i.e., face to face. For them, one-to-one or personalized instruction in the face-to-face mode setting is still the best way to deliver NFE programs to the aspirants. There is an urgent need for training the NFE providers to understand how to design, develop, and deliver ODDE programs. The ODDE experts and institutions in developing countries may come forward to identify, enrol, and train such providers who are significantly contributing to the NFE sector. Such training opportunities will help improve the availability of more ODDE for NFE programs and improve the quality of those that are available. Training in the field is also important, as the technologies of ODDE are changing very fast with the use of learning management systems, mobile apps, and many other tools such as augmented reality and virtual reality for skills development.

**Research on ODDE for NFE:** Considering the lack of research on NFE, national governments, international organizations, and educational institutions must come forward to support and fund research focusing on the effective use of ODDE for NFE at both policy and practice levels. It is equally important to carry out evaluative research on ongoing NFE schemes and projects in different parts of the world. The outcomes of these evaluative studies would build a knowledge base for the long-term sustainability of such projects in the future and their adaptation in different contexts. The other area for research may be to assess the impact of technology interventions in NFE programs and the possibilities of using OODE for NFE. Future studies on ODDE NFE may need to be situated in local contexts and adopt participatory approaches where all the stakeholders are engaged and contributing to the critical reflection and understanding. While the researchers use more qualitative approaches to study NFE, future research should also try using rigorous quantitative methods such as randomized control trial (Connolly, Keenan, & Urbanska, 2018) to focus on causality and theory building. The prospective areas for research related to OODE for NFE may include:

- Understanding and evaluating how ODDE NFE policies lead to improved practices
- Ways of using ODDE for NFE by different age groups
- Outcomes of using ODDE for NFE in different sociocultural contexts
- Influence of the ODDE in promoting NFE among adult learners
- The impact of ODDE-supported NFE on the individual's socioeconomic growth
- How the choice of digital tools for NFE shapes the learning outcomes

---

## Conclusion

The developing countries have a consistent desire to come at par with developed countries at most social and economic indicators. There is no single route to achieve this dream. The developing countries need to work on many fronts, and offering need-based ODDE for NFE is one such route. The ODDE helps the workers to gain further expertise and knowledge while remaining in employment, and this enhanced

competence helps them to further excel in their career. The updated knowledge of the workers also brings benefits to the multiple stakeholders that include governments, industries, markets, families, communities, and societies. Notwithstanding a significant correlation between socioeconomic development and ODDE, the developing countries hardly have any comprehensive scheme or mechanism to fund, support, and invest in ODDE for NFE. This chapter lists the potential reasons or challenges holding back developing countries to promote ODDE for NFE. Afterward, the chapter suggests some simply workable strategies for promoting and making the best use of ODDE in developing countries to offer NFE programs. We hope that governments of developing countries will take note of this analysis and implement the suggested strategies for promoting and maximizing the benefits of ODDE for NFE.

## Abstract

This chapter highlights the historical, current, and emerging trends on the borderless market for ODDE. The rate of growth of the global market for ODDE is unprecedented. Both the public and private sectors are capitalizing on the seemingly limitless opportunities to expand educational offerings and the innovative delivery of ODDE. In the twentieth century, there is evidence of distance education using media formats such as television and delivery of course material through correspondence programs. With the development of the computer and internet, the depth and scope of the ODDE market in the twenty-first century is changing every day. As venture capitalists seek new financially lucrative opportunities and alternative learning formats open doors for those who otherwise may not have had access to learning opportunities, questions and concerns remain. The digital divide (access and inequality), quality assurance, regulation, privacy, and security remain central to areas of concern in the ODDE

**Introduction**

Since the beginning of the twenty-first century, the market for borderless open, distance, and digital education (ODDE) has been in a period of accelerated and on demand growth. Every sector of education has experienced some form of change related to the emergence of advances in technology. Learning that was once confined to location, time, and brick and mortar buildings is now conceptually unlimited in terms of location, time, and design. It is entirely possible – and even common – to create curricula and learning environments in one part of the world using one language and deliver them in another part of the world using another language. With a few clicks on a keypad, a student can be sitting at home in Germany and enroll in courses delivered in Australia. Forms of ODDE are found across the traditional primary, secondary, and tertiary education sectors, but educational ventures opened by the digital age now include tutorial programs in all subject areas, self-guided language programs, formal credentialing, massive open online courses (MOOCs), continuing education or professional development programs, video conferencing, and growing podcast lecture series, and a number of learning apps.

The estimated overall growth in the ODDE industry is projected to reach US\$ 350 billion by 2025 (Globe NewsWire, 2020; Li & Lalani, 2020). In 2017, North America “held the largest market share of global online education” with the Asia-Pacific market poised to be the fastest growth market in the coming years (Globe Newswire, 2020, para. 7). In February 2020 at the beginning of the global coronavirus pandemic, a quarter of a billion full-time students in China moved to online instruction and to date it is the largest online movement in the history of education (Li & Lalani, 2020). In the USA, a large ODDE market that includes the company of Asia and Europe, it is estimated that 2.7 million K-12 students are engaged in some form of digital learning (Twinomugisha, 2019). In 2017, the whole US education market, including online and residential instruction, was valued at US\$1.3 trillion with an expected growth to \$2 trillion by 2026 (Schroder, 2019). Schroder (2019) notes that the education market has recently been drawing attention from venture capitalists with a number of edtech investors raising funds to create start-up educational programs that focus on moving a greater proportion of the students into online learning environments. Other closely connected entrepreneurial opportunities include supportive technologies such as course platforms, interactive video, security,

data analytics, and instructional design, all of which add to the industry's market growth (Schroder, 2019). Globe Newswire (2020), a private research and market firm, points to the advances in cloud-based solutions, increasingly interactive software and investments in security development as drivers for developing huge volumes of content online, and the growing comfort by end users in embracing technology-based learning. Other changes in the education market further enhance industry growth, such as declining cost to use online programming, increased revenue from high tuition fees, reports of lack of competence in staff at brick and mortar schools, and government investment in education (Globe Newswire, 2020).

There are, however, some questions about what is drawing investors to the ODDE marketplace. Surprises in the market include Coursera's US\$7 billion valuation in its initial public offering in April 2021. Coursera, a company co-founded almost 10 years ago by two Stanford University professors Andrew Ng and Daphne Koller, surprised many by selling much higher than expected shares at the initial public offering, catapulting the company to an industry leader in terms of highest valuation (McKenzie, 2021). It remains to be seen whether the high valuation of Coursera will pay off, but its recognizable brand, its business model of receiving direct payment from consumers, and having a history of partnering with government and businesses to deliver training and education to support the labor market seemed to be attractive features for those looking to invest in the online market (McKenzie, 2021).

The movement of educational programming to online platforms creates numerous opportunities, but it also calls into question the way in which online educational opportunity is translating with regards to equity and quality. A growing body of literature is illuminating the existing digital skills gap, access to the internet, special needs of at-risk learners, and the ability to transfer learning and skills globally as important issues for ODDE. Additionally, there are questions being raised regarding quality assurance, responsibility, and assessment of outcomes. Concerns raised by transnational educators in Australia reflect on setting effective price points, quality, training, academic supports, technical supports, and intellectual property (Croucher, Elliot, Locke, & Yencken, 2021, p.54). Both public and private entities have an interest in understanding how ODDE is being developed, delivered, and monitored to ensure that those seeking digital education are protected from bad actors and failed ventures.

---

## **Market Expansion and Attention to Access**

The convergence of the technological age with the growing global concerns related to educational performance and student outcomes has undoubtedly contributed to the ongoing and rapid growth in the market for ODDE. With computers expanding opportunities even more than radio and television had, technologically assisted delivery of education assuaged the disquieted concerns about overcrowded schools, access to qualified teachers, provision of academic support or remedial course, accommodating students requiring alternative learning spaces, and the disparities created by geographic barriers in rural education settings (Cavanaugh, Barber, &

Clark, 2009; Khan, 2012). As new educational ventures, curriculum models, and delivery methods were being discovered and tested, scholarly attention expanded significantly.

Journals such as the *Journal of Distance Education* (now the *International Journal of E-Learning and Distance Education*), *British Journal of Educational Technology*, *American Journal of Distance Education*, *Journal of Research on Technology in Education*, *Journal of Distance Learning* (now the *Journal of Open Flexible and Distance Learning*), and the *Journal of Online Learning and Research* were some of the earlier peer-reviewed journals publishing the earliest scholars in the field on the study on digital and distance education (Arnesen et al., 2019). Scholarship populating the field included seminal works written by Micheal Barbour, Elizabeth Murphy, Charles Graham, Jared Borup, Cathay Cavanaugh, Maris Rodriquez-Manzanares, and Margaret Roblyer (Arnesen et al., 2019). By the mid-to-late twenty-first century, the *Handbook of Research on K-12 Online and Blended Learning* (Kennedy & Ferdig, 2014) and the *Handbook of Distance Education* (Moore, 2013) produced collective works on theoretical, methodological, technological, and pedagogical research with a primary focus on open, digital, and distance education.

It is not a coincidence that evidence of the interest and amount of scholarship increased in the first decade of the twenty-first century. The years of 2006 and 2007 have been noted as unprecedented years in terms of the largest market growth in the technology age to date (Friedman, 2016). It is during this time that the tech industry opened the world to digital platforms enabling connectivity and data storage at a faster and more expansive rate than had ever existed (Friedman, 2016). In September of 2006, the first six TED Talk series were released for free online and reached more than one million viewers, offering access to “some of world’s greatest thinkers, leaders, and teachers” (TED, n.d.). TED Talks popularity in reaching the masses with informative educational content drove the development of the TED Translator program ensuring that its content could be viewed in a variety of languages which boosted viewership to 100 million views in just 2 short years (TED, n.d.). The year 2006 also marked the launching of Facebook and Google’s purchase of YouTube. But these were only the beginning; Hadoop’s cloud computing, Palantir Technologies’ big data analytics, Intels’ non-silicon computer processing material, VMare’s translation software for Rosetta Stone, Twitter microblogging, and Qualcomm’s 3G technology enabling the release of Amazon’s Kindle were just a few of the technological advances in the market shaping ODDE (Friedman, 2016). In 2007, the Apple iPhone entered the market, creating a reported increase of mobile traffic on the AT&T network by over 100,000 percent between January 2007 and December 2014 (Friedman, 2016). With on demand access to information and educational content in the palm of the hand, many barriers previously restricting learning became irrelevant. However, despite the global expansion of the internet providing on demand educational opportunities to millions who otherwise would not have had access, challenges regarding access continued to exist. Some of the biggest challenges include basic access to electricity, access to computer hardware and hardware incompatibility, language barriers, and broadband internet access (Richardson, 2011). This is the digital divide that separates individuals and communities with

the ready capacity to access the global information networks, from those who lack the devices and adequate internet services on which global knowledge systems increasingly rely.

---

## Access and Inequality Related to Digital Access

Over 800 million students around the world do not have a household computer (UNESCO, 2020), and although global internet access has nearly doubled in the past decade, only 47% of people living in developing economies and 19% of least developed countries (LDCs) used the internet in 2019 (Garrity, 2020). There is a similar disparity in internet usage by gender. Fifty-eight percent of males and 48.4% of females use the internet globally, but those percentages decrease to 52.8% of males and 40.7% of females in developing countries and 24.4% of males and 13.9% of females in LDCs (Garrity, 2020).

In addition to infrastructure and availability, digital literacy remains a significant barrier to internet use for people residing in Africa, East and South Asia, and Latin America (Garrity, 2020). The COVID-19 pandemic has also highlighted the limited pedagogical support available for teachers who are interested in or required to move their educational materials online (UNESCO, 2020) and for students in already under-resourced circumstances (Czerniewicz, 2018; Devkota, 2021).

Disparities also exist between the markets for the providers and consumers of ODDE. For example, of the 52 primary providers of MOOCs, 48% are based in North America and an additional 25% are based in Europe. Despite the initial promise of MOOCs to increase access to education, a 2019 study of participants in MOOCs offered by MIT and Harvard found that the majority of enrollments and certifications were from countries classified as “very high” on the UN Human Development Index (Reich & Ruiperez-Valiente, 2019). Although course content from the Global South exists, it can be difficult to find among the large quantity of Global North material that dominates these platforms (Czerniewicz, 2018). Similarly, the majority of providers of virtual K-12 education have been located in the Global North, particularly North America (77%) and Europe (11%), resulting in the majority of highly cited research related to virtual K-12 educational outcomes being focused on these regions as well (Arnesen et al., 2019). In countries with developing economies, ODDE may exacerbate existing educational inequalities that exist between students who live in rural and urban areas. In Nepal and Ethiopia, reliable internet access is concentrated in urban centers, placing learners in rural communities at a greater disadvantage (Belay, 2020; Devkota, 2021). ODDE facilitates the development of innovative educational technologies, but not all students benefit from these solutions equally (Belay, 2020). Additionally, the limited availability of languages in which ODDE content is offered reduces access for many learners. Upwards of 80% of ODDE online content is developed in one of ten languages, though in order to reach the equivalent percentage of the world’s population, content would need to be delivered in over 90 languages (Czerniewicz, 2018).

As technology continues to facilitate growth in ODDE markets, it is critical to consider the learners that are being excluded from participation due to limits in internet access, and infrastructure, and the availability of languages that programs are being offered in. It is equally important to recognize that there may be an inherent tension between the market orientation of ODDE and equality of access to the educational opportunities it provides (Czerniewicz, 2018). Although ODDE has the technological potential to expand educational access, market forces and profit-seeking service providers may ultimately reinforce existing access inequalities, thus prioritizing the expansion of established global consumer markets, rather than creating new ones.

---

## **Reskilling and Upskilling the Workforce in a Growing Technology Economy**

Despite the justifiable concerns, there are a number of innovative uses of ODDE aimed to advance the overall education level and the development of a nation's workforce. The ODDE market is both a resource for nations to build and sustain a knowledge economy and an avenue to meet what European Centre for the Development of Vocational Training (Cedefop)'s Executive Director, Jürgen Siebel, refers to as the crucial need for "building and maintaining employability for learners and workers and competitiveness for businesses" (Cedefop, 2021a, para. 4). ODDE resources can assist in developing new businesses, training and retraining the workforce, and to augment basic education at the compulsory level to support vocational education training through adult lifelong learning needs.

It has become increasingly evident that ODDE is a valuable asset to gain, maintain, and ensure employability and to meet national economic development goals. The ODDE market is not only providing educational opportunities to the individual user but also creating educational capacity for government strategic planning and training for corporations. National strategies targeted at reducing unemployment rates and domestic labor shortages, adjusting for the disappearance of low-skilled jobs, preparing an influx of immigrants to transition to the workforce, and meeting the growing demand for skilled labor in healthcare and the tech industries have sought to include the use of ODDE to address existing gaps in the current education level and/or skills of its citizens (Cedefop, 2021c; Cox & Prestridge, 2020; López Soblechero, Gonzalez Gaya, & Hernandez Ramirez, 2014; Stevenson, 2014). Long-standing issues like automation, sustainable use of resources, and the aging population, combine with emergent crises like the global pandemic, to influence and refocus the ways in which education, training, and career pathways are supported (Cedefop, 2021c). The European green deal (EGD) alone is estimated to contribute to an additional employment decline of 10% through 2030, particularly in jobs associated with coal and fuels (Cedefop, 2021c). Companies competing in the global market where the skill and training needs are rapidly changing and employee mobility is required are using differing distance education modalities and partnerships to accommodate the workforce. The degree of

adaptation is driven by both the market and for the market with attention to both reskilling and upskilling needs. Adult learners as well as those within the compulsory schooling years are benefiting from ODDE opportunities, often from within traditional educational sectors.

Australia's labor market is largely dependent on the vocational education training (VET) sector, with more than half of all occupation qualifications requiring VET, making it the country's largest education sector (Atkinson & Stanwick, 2016; Cox & Prestridge, 2020). The Australian VET sector is critical to the skilling and upskilling of its labor force by providing opportunities for both secondary and lifelong learning and shifting to online education offerings for some of the VET (Cox & Prestridge, 2020; Reeson et al., 2016). Reeson et al. reported current VET units being taught online in 2016 was around 14–20% and growing. International student enrollment is a significant driver in the need for online delivery of the Australian VET sector (Gao, 2020). Australia's leadership in the delivery of VET and its proximity to Asia has resulted in a number of VET partnerships between China and Australia designed to meet the needs of China's large vocational education market (Lawson, 2017). These cross border Sino-Australian educational developments suggest that ODDE in the VET sector is not only addressing national need but also needs across borders, particularly with nations in geographic proximity to each other. Countries such as Australia are responsive to the skill development needs outside of their country, which can also extend into the postsecondary sector. Memorandum of agreements between Australia and China have enabled the development of programs with private and public providers. Lawson (2017) notes that the number of students from China studying in Australia for VET is dwarfed by the number of students staying in China studying Australian VET qualifications; "for every Chinese student who came to Australia to study VET with a public provider, twenty Chinese students undertook VET training in China with Australian public providers" (p. 2). The partnership between China Electricity Council and Chisholm Institute of TAFE (Australian Technical and Further Education) is one such example of a Sino-foreign VET arrangement where Chisholm staff travel to China to provide training to students who will seek jobs in the electricity and supply industry (Lawson, 2017, p.7).

Ireland's recent 5-year reform of its VET sector, as part of its Further Education and Training Strategy 2020–2024 road map, is targeted to better meet and provide educational needs for its citizens. It is an example of connecting learners with more flexible learning modalities. Ireland's ecollege, an online learning platform, now delivers courses to students who are in need of specific skills and training or those returning to the job market. Ireland's national strategy to acknowledge differing learners' needs combined with offering flexible learning modalities enables the use of innovative digital technologies to support learning for "people with disabilities, new migrants, the long-term unemployed, ex-offenders, and women" (Cedefop, 2021b, p.43). Similarly, Spain has been addressing the need for more flexible delivery modalities for VET as part of its economic recovery plans, as its citizens, with a high (41%) unemployment rate for workers with minimal qualifications, are contending with disappearing jobs across the European Union related to technological advances and increasing automation (López Soblechero et al., 2014). López

Soblechero et al. (2014) note that online distance VET is needed for “its flexibility and ability to reach the largest number of students at a lower cost” (p. 1). This is significant in a country with 47% of the working age population having less than a secondary education level education, and an economy increasingly seeking more knowledge-based workers.

Reskilling the workforce through ODDE is evident not only in national strategic planning but also in the private corporate sector with partnerships being developed between companies and higher education entities to deliver new education and training skills to the currently employed workforce. Promoting this lifelong learning mindset is a central concern for many corporations as reskilling and upskilling employees will enable companies to adapt to the ever-increasing idea-to-product cycle time (Friedman, 2016). In a rapidly growing technological global economy, corporations need to adapt and provide flexible, fast education and training for its employees to remain relevant. AT&T, the world’s largest telecommunications company with approximately 300,000 employees, is a leader in corporate investment and strategy to upskill and reskill its employees (Friedman, 2016). By proactively assessing the skills its workforce would need to help meet their future corporate goals, AT&T, the “Big whale in the pathway of education to employment” (Friedman, 2016, p. 233), was able to seek out opportunities to partner with universities like the Georgia Institute of Technology, University of Notre Dame, University of Oklahoma, and online providers such as Udacity and Coursera to grant their employees access to online degrees and certificates targeted at the specific needs of AT&T, such as artificial intelligence, virtual reality, and predictive analytics.

---

## Quality Oversight and Regulatory

As the market for ODDE grows, many have noted advantages to the alternative learning format. ODDE opens doors of opportunity to many students who would not otherwise have access, those who are not successful in a traditional face-to-face classroom, or for those who need the flexibility in terms of time and location constraints (Darby & Lang, 2019; Khan, 2012; Ortagus, 2020). For these reasons, in the USA, online education has become the main source of enrollment growth in higher education, seeing a jump in enrollment from 5.9% in 2000 to 42.9% in 2016 (Ortagus, 2020). The demand from students seeking online education is in part generating the supply of online education programming. However, as in all well-designed growth strategy scenarios, externalities exist and counterweights of checks and balances are needed to assure quality (Kinser, 2014). The rapid growth of ODDE is raising questions about the monitoring and evaluating of student outcomes, the quality of the online courses, and privacy concerns: particularly as education management organizations (EMOs) and online management programs (OPMs) increasingly promote and recruit students to ODDE formats. From a policy perspective, protecting vulnerable student groups is a key consideration in the development of online programs, courses, and the overall cost benefit of online education with attention to including quality oversight (Ortagus, 2020).

Kinser (2014) points out that the modern iteration of quality assurance for traditional higher education programs “emerged during a time of increased markets and competition” (p. 63). Quality assurance measures thus are one way to provide consumer protection, avail students of choices in the marketplace, act as a source of information for stakeholders, and signal legitimacy of an institution. The growth of global, cross-border, and online education has challenged existing quality assurance principles rooted in local values, questioned who is responsible for assuring quality and how it is measured in overlapping cultural contexts. Even though markets and competition have been such a significant factor in the expansion of quality assurance, students as customers have not historically been the primary constituents of these efforts (Kinser, 2014). There is some evidence, however, that this may be changing.

In 2016, a class-action lawsuit related to the quality of courses delivered online was filed by students at George Washington University (GWU), prompting an overview of the online and hybrid delivery of courses at the institution (McKenzie, 2017). Findings from the report indicated that in some instances the same level of quality oversight was not given to the development and delivery of online courses at GWU as compared to the face-to-face equivalent courses and generated a GWU review of best practices for delivering online education (McKenzie, 2017). This case highlight that as ODDE has grown, the need for adequate resources specific to the delivery of ODDE to support educational institutions and protect students entering the ODDE market has also grown.

The development of the Online Learning Consortium’s (OLC) Scorecard is an example of an organization available for helping institutions evaluate and deliver online programs and courses. The Scorecard developed in the USA in 2011 is used by over 400 institutions and provides guidance on how to measure effectiveness of online programs with the use of handbooks, rubrics, and interactive dashboards (Online Learning Consortium [OLC], 2021). Colleges and universities can use the Scorecard for an “in depth review of instructional practices as compared to quality standards” (OLC, 2021). The Online Learning Consortium, in partnership with The State University of New York, the largest comprehensive university system in the USA, also offers a Course Design Review Scorecard, known as OSCQR. The course level design level scorecard is available for free, and consultants are available to assist with design, layout, technology, assessments, and interactive activities (OLC, 2021).

Quality assurance agencies monitoring and providing support services for the development of online learning are evident on a global scale. The International Network for Quality Assurance Agencies in Higher Education (INQAAHE) supports 250 quality assurance agencies in countries from Albania to Vietnam (International Network for Quality Assurance Agencies in Higher Education [INQAAHE], 2021).

---

## Emergent Issues and Future Research

The growing ODDE market opens many doors for those who would not otherwise have access to educational content and resources. Moreover, technology-enhanced education expands the capacity of nonresidential learning models to effectively serve

students. As ODDE is increasingly established as a core component of the provision of education globally, there are new issues, and new aspects of old issues, that need further attention and research. These include the privatization of the ODDE, especially through third-party management organizations; issues of security and privacy; and the changing expectations for educational flexibility and equity demanded in response to the global pandemic.

**Privatization** ODDE has developed in large part through extensive public-private partnerships. Much of the instructional design software, course management tools, and communication technologies in use today are the commercial products of private companies (e.g., Hill, 2019). The homegrown systems that may have populated early efforts have largely been supplanted such that there are few areas left where the private sector has not found its niche. These partnerships were initially based on tools needed to deliver programs at a distance or scale content on widely accessible programs. More recently, however, management organizations have taken responsibility for the actual operation of these programs. For example, Miron et al. (2021) document the profiles of the number of public schools in the USA that are now privately operated and increasingly owned by EMOs. These have predominantly emerged from market-based school reform initiatives and “a much-needed entrepreneur spirit and competitive ethic to public education” where competition is theorized as the motivation to drive improvement (Miron et al., 2021, p. 9). The Century Foundation has focused on the under-the-radar expansions of Online Program Management (OPM) companies in the USA (Mattes, 2017). The recent acquisition of edX by the OPM 2 U (Shaw, 2021) is an example of even when technology is developed in house (in EdX by Harvard and MIT), the trend suggests it will be commercialized and a for-profit entity (in this case 2 U) can ultimately assume control.

While the pattern of management organizations like the Knowledge is Power Program (KIPP) or 2 U appear to be filling a void in the education market for some, Miron et al. (2021) and Carey (2019) highlight that challenges exist with the vast organization of privatizing public education, particularly with analysis of the organizations, as multiple corporate parties are involved and many of the owner’s or corporate headquarters are located at a distance or are “geographically distributed” across regions making monitoring and evaluating these entities difficult. The Century Foundation’s multiple reports show that that OPMs have evaded oversight because of their status as a third-party contractor (Dudley, Hall, Acosta, & Laitinen, 2021). Market-based school reform initiatives are not new but with the increasing prevalence and “players” in the market, consideration of benefits, outcomes, student involvement, and student demographics are a few of the areas where grounded empirical research on the market-based approach are needed (Gulosino & Miron, 2017). Additionally, determining how quality is measured and who is responsible for monitoring quality in the growing private market should be further evaluated.

**Security and Privacy** The twin issues of security and privacy in online education, particularly for children, has become increasingly important. Remote monitoring of

online activity – whether to measure time on task, establish metrics for learning modules, or guard against cheating – allows authorities to observe not only student behavior but also the personal environment where learning is taking place. Data on students and their families can be gathered by companies providing software and access to school materials and then used to enhance marketing or sold to third parties (Lieberman, 2020). Efforts to use technology to monitor students for cheating have been shown on the one hand to be an effective tool (Dendir & Maxwell, 2020), and on the other hand still result in false accusations that are difficult for the innocent to defend against (Singer & Krolik, 2021). As a regulatory issue, data privacy has received much attention in some parts of the world (e.g., the General Data Protection Regulation in the European Union), but global standards have not been established. Future research should examine how the security and privacy of ODDE students and teachers can be protected and assured.

**Changing Expectations** The global impact of the coronavirus pandemic may not be fully realized for years to come, but the unprecedented demands in the ODDE market may very well point to the future areas of growth. As a result of the lockdowns and school closures, UNESCO’s global monitoring reports that over 210 million learners have been affected across all education levels: preprimary, primary, lower secondary, upper secondary, and tertiary (UNESCO, n.d.). Supporting “learning recovery” during COVID recovery has become a primary goal for UNESCO’s Global Education Coalition (GEC) in action (UNESCO, 2021). GEC notes that there is an “urgency to invest” and “create innovative partnerships” to further prevent losses in learning, increasing drop-out rates, potential downstream economic, labor market, and social impacts (UNESCO, 2021, p. 8). One key objective proposed by the GEC is to scale up distance learning and connect every learner to the internet and in this way pursue attainment of the fourth Sustainable Development Goal (SDG), ensuring “inclusive and equitable education and promote lifelong learning opportunities for all” (p. 40). The pandemic has in many ways reinforced much of the already pre-pandemic national strategic initiatives focused on education as a path towards economic recovery and aligning workforce skill acquisition with the changing skill needs in the labor market. In other ways, the coronavirus pandemic has been a reminder of the value of partnerships and collaboration to bring about change to meet the needs of the globally diverse student populations. In this pursuit, future research should explore how the convergence of investment and innovative partnerships serves to produce ODDE models best designed at providing equity.

---

## Conclusion

Removing the classic constraints of geography and time through ODDE opens up new possibilities for the variety of students seeking educational opportunity. There is growing evidence of developing collaborative partnerships both within geographic regions and also across borders in all educational sectors. These partnerships are growing out of a demand for upskilling, the need for reeducation of the labor force, a

recognition of the lack of local resources, and the development of national strategic plans focused on diversifying the workforce, reducing unemployment, and competing in the global economy.

As the demand for ODDE continues and partnerships grow, so does the number of stakeholders. The sheer magnitude of the financial opportunity inherent in the ODDE market has prompted venture capitalists to increasingly support entrepreneurial endeavors in the education sector. Determining the outcomes, quality, and overall benefit to the students and society at large will continue to be a primary focus of study as the ODDE market evolves and continues to grow.

Developing parallel to the growth of ODDE markets is a growing need to understand the market trends and how organizations such as EMOs and OPMs are using these trends to further develop programs and unbundle services. Data analytics companies like HTF Market Intelligence and Market Data Forecast aggregate and analyze data on various market sectors of ODDE and then charge fees for other groups or companies to access the information. As countries and educational institutions seek to maintain their market competitiveness, the organizations with the greatest financial resources will predictably have greater access to and thus benefit the most from these data analytics. This reality draws further attention to issues of equity and access. Though education management organizations (EMO) are growing due to increased market demands, it remains to be seen whether or not these demands reflect the needs of all students and whether or not certain groups of students will continue to be excluded from the market.

Overall, the immense ODDE opportunities available to learners with access to digital resources is unprecedented, regardless of whether it is free or fee for service, sought for personal lifelong growth or required for the demands of the labor market. And while new players may enter the open and borderless education market without consideration for the importance of student outcomes and protecting at-risk populations, the tremendous benefits of envisioning and then offering new mediums for the delivery of education challenges the traditional ways in which education is delivered and provides a ripe environment for expanding educational opportunity. In any market in which independent producers and consumers exist, there will be trade-offs. Given the relative infancy of ODDE, identifying and labelling these trade-offs in ODDE remains challenging. If an understood goal of ODDE is to improve access to education for all persons, then a deliberate push for transparency through the elimination of information asymmetries should be a clear priority. Greater transparency, particularly in the world of ODDE, should lead to greater benefits to the individual student on both a personal and professional level, and in turn should also lead to greater benefits to society at large. It is not clear, however, whether the current regulatory structure is sufficient to compel such transparency. In the market for borderless ODDE, consideration for positive analysis (behavior of individuals or organizations with response to change) and normative analysis (value judgments) will need to be ongoing and responsive to the changing market with regard to the what, how, and whom of how students are choosing among their options in ODDE, and what type of content the producers of education choose to offer. This will be especially true with a rapidly changing educational environment in which ODDE continues to operate.

## Abstract

The concept of Virtual Internationalization systematizes the many possible uses of digital technology in the internationalization of higher education. It is rooted in a comprehensive understanding of internationalization that encompasses the entire institution. Virtual Internationalization includes, but is not limited to, curricular concepts such as virtual mobility, virtual exchange, and virtual study

abroad. Beyond the curriculum, it also involves the internationalization of management and administration, academic and teaching staff, and the role of digital technology in physical student mobility, international partnerships, collaboration, and transnational education. Moreover, Virtual Internationalization systematically integrates online and distance education. Study programs that are offered fully online or at a distance are thus brought out of the blind spot of internationalization.

**Introduction**

Many higher education institutions around the world have internationalization high on their strategic agenda. A key objective of internationalization is the provision of international experiences to students – traditionally, through opportunities to study abroad for a period of time. However, physical mobility remains a privilege for a minority. Despite low-threshold and short-term programs (Erasmus+, summer schools, etc.), most students will not have experienced international learning mobility by the time they graduate. This is certainly true for open and distance universities (with their generally nontraditional clientele), but also for campus-based institutions. In the European Union, for example, the proportion of students with study-related international experiences in 2019 was estimated at between 13.5% (European Commission, 2020a) and 20% (Hauschildt, Gwosć, Schirmer, & Cras, 2020). Digitalization has also changed international activities in higher education and promoted “distant” forms of internationalization. Subsequently, virtual collaboration practices from online and distance education (ODE) have been introduced in campus-based international education. In addition, Open Educational Resources (OER) and Massive Open Online Courses (MOOCs) have opened up transnational education: Teaching and learning materials and entire courses have become available to anyone, anywhere at a global scale.

The concept of Virtual Internationalization (VI) has been developed to systematize the impact of digitalization and information and communications technology (ICT) on higher education internationalization (Bruhn, 2020). It is embedded in the internationalization discourse, which has become more complex in recent years. Initially focusing on physical student mobility and international partnerships, new aspects have emerged. The *Internationalization at Home* (IaH) movement (Crowther et al., 2000) in particular has left its mark, and today internationalization is often seen as a transversal concept that encompasses the different organizational levels of higher education. In the model of Comprehensive Internationalization (Helms & Brajkovic, 2017; Hudzik, 2011), this transversality is articulated particularly clearly.

Digitalization has had a massive impact on higher education, including in the area of internationalization. The advent of the Covid-19 pandemic has been a catalyst in reinforcing respective developments, with virtual forms of mobility having gone from niche to mainstream (Hudzik, 2020; IAU, 2020). The shift to (emergency) remote teaching and massive constraints on physical mobility have promoted virtual, hybrid, and blended study abroad. Such arrangements imply that students participate in classes from their host institution remotely – either as a complete substitute for physical mobility (= virtual), as an optional alternative to on-campus classes (= hybrid), or in combination with physical participation in classes (= blended) (Gaebel, Zhang, Stoeber, & Morrisroe, 2021). The crisis also boosted other distant forms of internationalization, including collaborative online international learning (COIL) or virtual exchange, in which classes from different countries collaborate remotely on a given project or topic (IAU, 2020; O’Dowd, 2021). Online conferences and virtual staff exchanges were offered, and international partnerships were used to pool resources for remote teaching and learning (European Commission, 2020b; IAU, 2020); ODE moved to the center stage of internationalization (de Wit, 2020; Kanwar & Carr, 2020).

Traditionally, higher education delivered entirely online or at a distance has not played a major role in the internationalization discourse. The only aspect that has been commonly studied is virtual transnational education (TNE) (François, Avoseh, & Griswold, 2016; Knight, 2016). The classification of Comprehensive Internationalization (Helms & Brajkovic, 2017) places ODE in the category of *collaboration and partnerships* – as part of “other offshore programs.” While it is true that online TNE can be offered in collaboration with local partners (“locally supported distance education,” Knight, 2016, p. 39), it can also be delivered independently of foreign partner institutions (“foreign sending provider operates without any formalized academic collaboration with local [institutions],” Knight, 2016, p. 39). A classification in the category *collaboration and partnerships* would therefore hide an important aspect of international delivery of ODE. Moreover, ODE is often not directed at an international clientele, but at a domestic one. Given the fact that this mode of study is becoming increasingly important around the world (e.g., Qayyum & Zawacki-Richter, 2018), IaH elements in ODE expand access to international experiences to a growing clientele. As a result, ODE degrees with a domestic focus may find international students enrolling in them.

Due to the complexity described above, in the VI concept, ODE is systematically included in the conceptualization of internationalization of higher education for the first time. The concept allows scholars and practitioners to systematize the entire spectrum of applications of ICT in higher education international contexts. It also offers possibilities for connection to open education (e.g., via transnational OER and MOOCs) and to other educational subsectors (e.g., secondary schools, technical and vocational education).

This chapter exploring VI in ODE begins by providing a definition, followed by a brief overview of the literature. Next, the two dimensions and typical means and measures are explained before the six parallel pillars of VI are presented in detail. This is followed by a discussion of the implications of the concept for the broader internationalization and ODE discourses. The relevance of the concept for research,

as well as for campus-based and ODE institutions, is then discussed. Opportunities and limitations of the concept are then summarized.

## Definition

Based on the longstanding definition of internationalization by Jane Knight (2003), VI is defined as “*the process of introducing an international, intercultural, or global dimension into the delivery, purpose or functions of higher education with the help of information and communications technology (ICT)*” (Bruhn, 2017, p. 2). This definition captures the connection between ICT and internationalization in a comprehensive sense, by including ICT-supported measures and processes at different organizational levels. Filling this definition with life, the VI concept is based on the model of Comprehensive Internationalization (Helms & Brajkovic, 2017) and integrates all six categories (see Fig. 1). Aside from *physical student mobility*, it also includes *collaboration and partnerships*, as well as IaH measures in the (home) *curriculum, co-curriculum, and learning outcomes*. In addition, *administrative leadership, structure, and staffing* form part of the comprehensive approach towards internationalization, and so do *faculty policies and practices*. *Strategies and articulated institutional commitment* is conceptualized as transversal to all VI. Beyond this, ODE is added as a seventh category. This addition is made in order to facilitate the identification of the different affordances of distance-only vis-à-vis primarily face-to-face education. VI thus encompasses the two traditional categories of *Internationalization Abroad* (mobility of people, programs, providers, projects/services, and policies) and *IaH* (curriculum, extracurricular activities, research, etc.) (Knight, 2012).

## Literature on the Topic

VI, as a comprehensive concept, was first mentioned in Bruhn (2017) and conceptualized in more detail in Bruhn (2020). Prior to that, terms including “Virtual Internationalization,” “digital internationalization,” “e-internationalization,” and

**Fig. 1** The six parallel pillars and one transversal category of Virtual Internationalization. Note: From “Virtual Internationalization to Support Comprehensive Internationalization in Higher Education” by E. Bruhn-Zass, 2021, *Journal of Studies in International Education*. (Reprinted with permission)

“online internationalization” had been used inconsistently. As no clear-cut distinction could be determined between the terms, they are treated as synonyms in this cursory literature review. Two distinct concepts were identified:

1. **VI as a curricular concept.** Terms like virtual, digital, or online internationalization are often used to designate forms of virtual study abroad or collaborative online exchanges, in which students obtain an international experience without physically leaving their home. As early as 1999, Blight, Davis, and Olsen argued that “new technologies may allow a Virtual Internationalisation of the form of the curriculum” (p. 27). Further sources to be cited here include Fugate and Jefferson (2001), Wächter (2002), Ghasempoor, Liaghatdar, and Jafari (2011), Mavridis, Leftheris, Tsiatsos, and Kudryavtseva (2012), EICL Project (2013), Middlemas and Peat (2015), and Thorne (2016).
2. **VI in transnational education (TNE) and global “virtual universities.”** In this perspective, VI is conceptualized as virtual TNE which “encompasses the utilization of ICT to dispense transnational education programs and courses to students” (Alqahtani, 2018, p. 4) or as a means to recruit international students into domestic online or distance programs (Lorenz, Wittke, Steinert, & Muschal, 2016). Additional sources that follow this approach are van Damme (2001) and Samoilenko (2013).

A broader conception is implicit in Teichler and Cavalli (2015), who propose “any type of Virtual Internationalization or globalization” (p. S114), yet without further specifying the term. For Knight (2014), virtual aspects of internationalization figure in the “program and provider mobility” (“second generation”) category of her classification of three generations of crossborder higher education (p. 45). They include both the “virtual university” and “online/distance” program mobility.

Among the more comprehensive approaches to internationalization with ICT is Leask (2004). She discusses a variety of ways in which higher education institutions can “use ICTs to assist in achieving internationalisation outcomes” (p. 340). Examples given relate to curricula, as well as to international faculty connections and research. A still broader conceptualization can be found in Hénard, Diamond, and Roseveare (2012). The authors describe ways in which ICT can support internationalization: helping institutions collaborate and compete, overcoming countries’ regulatory policies (such as immigration policies), fostering partnerships for joint programs, recruiting foreign experts, offering virtual mobility options, and democratizing access to international learning experiences (Hénard et al., 2012, p. 28). It was not until Bruhn (2017) that a comprehensive approach appeared, which other scholars have since supported (e.g., Bedenlier & Marín, 2020; de Lima, Bastos, & Varvakis, 2020; Hartzell, 2019; Nascimbeni, Burgos, Spina, & Simonette, 2020; Tjulin et al., 2021).

The advent of the Covid-19 pandemic in 2020 has intensified the discourse on virtual forms of internationalization. The idea of the shift to online education as a “catalyst for a new normal” in internationalization (Hudzik, 2020, p. 1) has become widespread. Li and Haupt (2021) argue that distance TNE could become a growth

area post-Covid-19, with Ogden (2021) adding that education abroad may have to be re-defined due to the increasing nonphysicality of international experiences. Ogden, Streitwieser, and van Mol (2020) suggest that the shift to online teaching and learning caused by Covid-19 can accelerate looming opportunities for international higher education by challenging the primacy of physical mobility and other “traditional” forms. Hunter and Sparnon (2020) equally see an “opportunity in crisis,” namely, to embrace the full potential of online education and collaboration for internationalization. By making continued use of ICT for internationalization, White and Lee (2020) argue, deficiencies of mobility can be circumvented. These deficiencies include high cost (and as a result: unequal access), brain drain, and environmental issues – in particular, CO<sub>2</sub> emissions generated by travel (cf. also Bruhn-Zass, 2021).

These sources share the view that universities will have to diversify their understanding and practice of internationalization by incorporating ICT and approaches from the ODE field, not only as an emergency response, but also strategically, in the mid- and long term (cf. also Zhou, 2021). The extent to which this is going to be the case is highly contested – ranging from scenarios of a “postmobility world” (White & Lee, 2020) to a by-and-large return to the prepandemic status quo (Altbach & de Wit, 2020), with most scholars settling for something in the middle.

A related concept to VI is that of *Internationalization at a Distance* (Mittelmeier, Rienties, Gunter, & Raghuram, 2020; Mittelmeier, Rienties, Rogaten, Gunter, & Raghuram, 2019). It takes into account “all forms of education across borders where students, their respective staff, and institutional provisions are separated by geographical distance and supported by technology” (Mittelmeier et al., 2019, p. 2). The concept adds a complementary perspective on ICT-supported internationalization: While VI addresses the transversal role of ICT for internationalization and thus encompasses the areas of IaH and Internationalization Abroad, Internationalization at a Distance is developed as a parallel category that focuses exclusively on remote experiences.

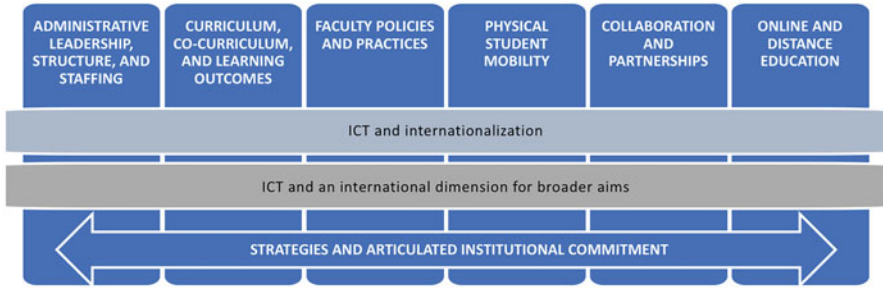

In summary, recent years have seen scholars and practitioners discuss ICT use in various international contexts. The Covid-19 pandemic and questions around a postpandemic “new normal” have intensified this discussion. The concept of VI represents a more comprehensive approach towards ICT-supported internationalization of higher education than other concepts in the literature.

---

## Dimensions of VI

Two dimensions of VI are distinguished (see Fig. 2):

1. *ICT and internationalization* describes, in a narrower understanding of internationalization, how ICT is used to internationalize or to meet the challenges of internationalized contexts (intercultural diversity, geographical distance, etc.). Respective aims or functions include the development of intercultural, international, and global competencies, the enhancement of the experience of

**Fig. 2** Seven categories and two dimensions of Virtual Internationalization. Note: From “Virtual Internationalization to Support Comprehensive Internationalization in Higher Education” by E. Bruhn-Zass, 2021, *Journal of Studies in International Education*. (Reprinted with permission)

international students (including online and TNE students), improvement of the experience abroad, access to an international experience, and the export of higher education.

2. *ICT and an international dimension for broader aims* contain more general objectives that are to be achieved by combining ICT with an international aspect. These include broader skills, competencies and knowledge, innovation in teaching and learning, the enhancement of staff and faculty training/development, capacity building, and quality enhancement.

This distinction of two dimensions is made for analytical purposes. It has limited relevance for practice, since the goals of internationalization are usually formulated on both levels from the outset: Intercultural competencies, for example, go hand in hand with skills in dealing with diversity, and an expansion into foreign markets generally has the aim to create high-quality educational offerings (capacity development) (cf. Tait & O’Rourke, 2014, p. 45). In fact, as scholars have emphasized, internationalization and its broader functions are inextricably linked (Brandenburg, de Wit, Jones, & Leask, 2019; de Wit, Egron-Polak, Howard, & Hunter, 2015, p. 29).

## Means and Practices in VI

Digital technologies commonly used in higher education can also be employed in international contexts. These include different kinds of online media and e-learning platforms, as well as social media and virtual communities. Websites play a role, especially for transnational marketing and information on exchange programs. MOOCs are often employed as an international marketing tool, while they can also enrich the (flipped) classroom. OER can be used transnationally, and games/gamification can be introduced in learning environments to engage international learners. M-learning can help access content with mobile devices *anytime, anywhere*, and virtual and augmented reality can create impressions of distant places.

Internationalization-specific means and practices prominently include virtual mobility – in the form of COIL/virtual exchange or other formats such as online internships and study abroad at a distance. They furthermore include virtual TNE, in which students from abroad enroll in online or distance degrees. ICT can also be utilized to engage learners in interculturally diverse courses, or for standardizing processes and reducing bureaucracy across borders (supporting enrollment via data portability, recognition of credits, etc.). Moreover, ICT can be used in staff/faculty development, in transnational e-mentoring or e-tutoring, or to facilitate collaboration at a distance among staff/faculty in different countries.

---

## The Six Pillars of VI

In the following, the six parallel pillars of VI are presented, with a particular focus on the different aims and functions that may be addressed.

### Administrative Leadership, Structure, and Staffing

Higher education administration and management have been identified in Bruhn (2020) as key stakeholders for tapping the potential of ICT for internationalization. They are largely responsible for the development of strategies and articulated institutional commitment (as in the transversal category of VI, see Fig. 1), and they also directly promote ICT-based internationalization activities, for example, in the form of financial or structural support for virtual exchange. International office staff play a key role for introducing and supporting VI activities (as displayed in the other pillars of VI). Hiring and developing administrative staff is important in order to build up the necessary competencies for using ICT in international contexts (and beyond). This may include targeted staffing, formalized training, or nonformal support services (networks, software tools, etc.). ICT-supported staff development is also used in international contexts for broader aims of increasing access, capacity, or quality (at home and abroad), for instance, by developing and promoting global standards.

### Curriculum, Co-curriculum, and Learning Outcomes

In the curriculum, various ICT-based measures can be used to integrate an international experience. These include *virtual mobility*, which Bruhn (2020) uses as an umbrella term for virtual forms of study abroad, exchange, field trips, transnational labs, or expert mobility. ICT-supported internationalization of curricula and co-curricula also includes “nonmobility” forms such as the use of teaching/learning materials from abroad.

A frequent aim of internationalization is the promotion of intercultural, international, and global competencies. This includes the enhancement of intercultural understanding and language skills. Improved access to the acquisition of such

competencies beyond the “mobile few” is a frequently cited argument for the use of ICT in IaH. Forms of virtual mobility commonly serve these purposes.

In addition, ICT can expand opportunities for connecting international and domestic students within the same institution or program: Virtual platforms allow both groups to get in touch and collaborate with each other, whether they are on the local campus or abroad. ICT is also used for the broader aims of enhancing the quality of curricula, access to education, and capacity building. Examples include the transnational provision of OER or MOOCs to institutions in developing countries, or the application of gamified learning to engage international students enrolled domestically.

Employability and preparing students for the living and working conditions of the twenty-first century – *twenty-first-century skills* – are broader aims of the use of ICT in international curricular contexts. For example, virtual exchange can be used to create collaborative and transversal competencies and to train students in dealing with diversity. Broader aims also include the enhancement of discipline-specific knowledge and skills. For example, virtual exchange in a design, art, or architecture course can serve to broaden students’ horizons with approaches from other cultures.

Finally, VI can involve innovation in teaching and learning – for instance, when international MOOCs are used to create flipped classroom experiences.

## Faculty Policies and Practices

Academic and teaching staff are vital for implementing VI. They engage in remote international research collaboration, implement IaH in curricula, and provide education and academic support for international (online) students (Bond, Marín, & Bedenlier, 2021).

Institutional policies can address both domestic and international staff and concern their recruitment and professional development. Among the measures are online training that coaches domestic faculty in conducting successful international exchanges and transnational cooperation or in dealing with international students. Other training is aimed at international lecturers and researchers, for example, to help them navigate the domestic higher education system.

Among the broader aims addressed in this category is again innovation in teaching and learning – for example, when social media is used for transnational professional exchange on teaching practices. Other aspects are broader skills and competencies obtained in transnational cooperation – beyond intercultural and international competencies.

## Physical Student Mobility

To support physical student mobility, ICT is used for both domestic students studying abroad and for international students on campus. For both groups, ICT can also be used during periods when students cannot be easily reached by other means – in a sense, *anytime, anywhere*. This includes the *before* (predeparture) and

*after* (alumni) phases for international students and the *during* (study abroad) phase for domestic students. By embedding physical mobility in virtual offerings, ICT also facilitates seamless transitions from one phase to the next, for example, when orientations are begun prior to the actual stay.

ICT diversifies the possibilities for advising and for enhancing the overall experience for mobile students – by adding chat, webinars, tutorials, predeparture online language courses, or automated data transfer between institutions (as with Erasmus Without Paper (n.d.)). Blockchain is sometimes considered a promising technology for supporting data and credit transfer.

ICT is also widely used in international marketing and the promotion of study-abroad – with social media marketing in particular. International exchange programs can also become more attractive through virtual IaH: Students who have been introduced to international experiences at home may be more inclined to pursue a stay abroad. Possibilities to blend shorter physical mobility stays with virtual elements can also improve access to international experiences for those students who are unable to spend a longer period abroad.

Employability is a central theme among the broader aims of ICT use in physical mobility. For example, e-portfolios are used to make professional skills acquired abroad visible.

## **Collaboration and Partnerships**

ICT can foster and support international partnerships at departmental or institutional level. Examples of applications include digital communication channels and intrainstitutional collaboration platforms (for e-learning, MOOCs, or OER).

ICT diversifies transnational education through blended or hybrid learning options and can thus be used to support the presence of universities abroad. Such diversification can serve to enhance the experience of international students at a branch campus. This is done, for example, through the flexible provision of educational services and the ability to address intercultural challenges between home institution and branch campus – be it with interculturally sensitive online elements, e-mentoring, or with social media tools that create a sense of community.

In terms of the broader aims of ICT use in international collaborations and partnerships, access to higher education and capacity building are key issues – in TNE and other forms of collaboration, such as dual degree programs. Finally, innovation in teaching and learning is an issue in this category. The focus here is on aspects such as improving teaching in TNE or supporting international double-degree programs. ICT facilitates transitions for students from one institution to another and fosters curricular innovation at all participating institutions.

## **Online and Distance Education**

Looking at domestic ODE, ICT-based interventions are often the only way for students to gain study-related international experience – instead of an alternative

or supplement of physical mobility, like is the case in campus-based internationalization. This is also due to the enrollment structure inherent to distance education, that is, learners tend to be older and have family and/or job commitments (e.g., Dolch & Zawacki-Richter, 2018). Virtual exchanges and the enrollment in courses from a partner institution (virtual study abroad) are examples. Where international students are enrolled, taking advantage of this diversity can contribute to the internationalization of the study experience.

A broader aim of integrating international aspects into domestic online and distance learning is to tap into knowledge and expertise from abroad, aided by the location-independence of study. The barrier to inviting international experts into the classroom is lower, as neither they nor the students have to physically travel. Looking at transnational delivery, distance, and even online offerings were early forms of TNE (François et al., 2016, p. 7). Via virtual TNE, ODE can provide an international education for students in another country who would not be able to travel abroad nor have access to “physical TNE” in the form of a branch campus (Li & Haupt, 2021). This increases access to an international experience. Hand in hand with this are the broader aims of increasing access to higher education, as well as capacity development and quality enhancement of education. This applies to developing and emerging economies, but can also serve to counteract regional disparities in industrialized nations. Virtual TNE can also be used to address particular student groups such as expatriate or military learners.

---

## **Implications and Insights from the Concept of VI for the Higher Education Internationalization and ODE Discourses**

The concept of VI sheds light on the diversity of possible uses of ICT in higher education international contexts. It helps to examine how ICT can be used in the sense of Comprehensive Internationalization. Unlike concepts such as COIL or virtual exchange, VI is not limited to the curriculum. It concerns the university in its entirety – be it administrative, academic and teaching staff, physical student mobility, international partnerships, or other forms of collaborations and TNE. The combination of physical and virtual elements leads to a hybridization of internationalization.

In the VI concept, ODE is systematically included in the conceptualization of higher education internationalization for the first time. Study programs that are offered entirely online or at a distance – and which have been increasing worldwide for years (e.g., Qayyum & Zawacki-Richter, 2018) – thus step out of the blind spot of internationalization. In fact, for students enrolled, VI may be the only accessible form of internationalization. This applies to domestic students who are unable to physically travel abroad and to international students who are either enrolled in virtual TNE or in primarily domestic higher education. It should be noted that distance learning institutions and open universities differ from campus-based institutions especially in the area of the curriculum and (partly) in that of partnerships, while the other pillars of VI apply to them in the same way as to (majority) campus-based higher education institutions.

Virtual forms of internationalization are not easily described with the vocabulary traditionally used in the internationalization discourse. In particular, the dichotomy of “at home” vs. “abroad” (Knight, 2012) loses its coerciveness. Students may seamlessly mix domestic with international experiences regardless of their current location, orientations for international students may begin even before arrival on campus, and credentials for joint degrees may be obtained entirely online. The conceptualization of a third category, Internationalization at a Distance (Mittelmeier et al., 2020), has been offered to integrate hybrid as well as fully distant and online education into internationalization theory. The VI concept does not contradict this approach. It merely takes a different perspective by focusing on the permeation of both IaH and Internationalization Abroad with ICT, while integrating the roles of strategic management, administration, and faculty in a comprehensive sense.

---

## Relevance for Research

VI is designed as transversal to the comprehensive internationalization of higher education. The concept broadens the perspective of ICT use in these contexts by providing a framework for examining the impact of ICT on higher education internationalization in all its complexity.

Future research may further explore areas of VI that have so far not been studied in depth. These include curricular aspects other than virtual exchange, the impact of ICT on partnerships and international relations, as well as the role played by strategies, administration, and academic and teaching staff. Influences from outside of individual institutions, including sectoral policies, trends and crises, may also come into focus. A particular blind spot so far has been the international side of ODE. The ways in which ODE is internationalized – and how ODE permeates international education – may be further researched.

Future research may also study VI in open education and other education sub-sectors, including in their online and distance delivery formats. The impact of digitalization on international operations of primary and secondary schools and technical and vocational education has yet to be studied in depth. Furthermore, in order to provide guidance for practitioners, it would be advisable not only to focus on the opportunities that ICT opens up, but also to consider their limitations, as well as success factors.

---

## Relevance for Primarily Campus-Based Institutions

Digitalization has had an impact on higher education internationalization for years. Hybrid and blended offerings have proliferated, and virtual exchange (COIL, or related concepts) has obtained a prominent place in IaH activities. The comprehensive concept of VI broadens the perspective beyond such collaborative experiences, shows how ICT can be integrated in curricula in other ways, and promotes the internationalization of institutions beyond the classroom. What is more, the Covid-19

pandemic has demonstrated that resilient internationalization practice should include virtual elements to sustain international relations and maintain international experiences during times when physical mobility – and potentially, campus operations in general – are compromised.

Aspects of sustainability also challenge the primacy of physical mobility. The carbon footprint may be reduced by moving project-related meetings online, thus limiting (air) travel and contributing to climate action, the United Nations' Sustainable Development Goal (SDG) 13. Other sustainability aspects may come into play as well. Exemplary opportunities of VI lie in promoting quality education (SDG 4), reducing inequalities (SDG 10), and improving gender equality (SDG 5), for example, by increasing access to international higher education for disadvantaged populations through virtual TNE.

---

## Relevance for ODE Providers

Rationales for ODE providers to consider comprehensive internationalization, including the ODE-specific approaches provided in the VI concept, include the following.

1. ODE has gained in importance in higher education in recent years and is likely going to play a larger role in years to come. This development encourages the consideration of how international experiences and institutional internationalization can be integrated to serve all students, not just those enrolled in on-campus education.
2. ODE has a role in educational delivery to nontraditional learners. Access to an international experience to this student group is essential to ensure equitable opportunities.
3. As ODE also serves students from abroad (intentionally or unintentionally), it is important to recognize and accommodate their needs.

---

## Conclusion

By taking a comprehensive look at the possibilities of using ICT for internationalization, the VI concept can help higher education leaders and internationalization practitioners to systematically integrate virtual elements into strategies and activities. The broad portfolio of VI, with its claim to comprehensiveness, can open up new avenues for internationalization. The VI concept invites ODE practitioners to fully participate in the internationalization discourse. ODE is included in VI in two perspectives:

1. Education that primarily targets a domestic clientele (whether or not international students are enrolled)
2. Education that targets students abroad (virtual TNE)

It should be emphasized that other areas of comprehensive internationalization (strategies, administration, faculty, and partnerships) apply to ODE institutions just as they do to all other institutions. A particular area of opportunity is the combination of expertise and experience from on-campus education with that from the ODE field.

VI is a concept developed for higher education, but other educational subsectors may also integrate its principles. International experiences and intercultural competencies are not only relevant for higher education, but for society as a whole. ICT and digitalization have massively impacted other educational subsectors as well. Following this development, collaborative virtual exchange has been implemented in secondary schools (Chia & Pritchard, 2014), and other formats such as virtual internships or expert mobility may be considered in technical and vocational education in particular. In these subsectors, too, it may be advisable to broaden the perspective beyond curricular forms of VI.

It is important to acknowledge limitations of VI. A lack in digital literacy or in technical infrastructure, for instance, can counteract well-intended efforts. Therefore, VI should be weighed against other (physical) measures in different contexts. Success factors and obstacles must be analyzed and taken into account. For a successful implementation of VI, research and practice must go hand in hand.

## Abstract

International students are a group of rising prominence in open, distance, and digital higher education, although there is, at present, limited systematic data about their numbers worldwide. International students in open, distance, and digital education occupy an interesting “third space,” whereby they commonly remain within their home environment and surroundings while simultaneously studying from an institution-based abroad. This means that many of the lenses used to frame and categorize international students in face-to-face settings – mobility, visas, and citizenship – are found problematic in online distance settings. This chapter reflects on these issues to outline complexities in categorizing international students in open, distance, and digital higher education and

the ways that their experiences may be distinct from international students who are geographically mobile. The chapter ends with a reflection on gaps in current research and suggestions for researchers who include international students in their work.

**Introduction**

International students represent a significant and growing population of open, distance, and digital education (ODDE) students, supported through increasing provisions for international distance education (Simpson, 2013; Subotzky & Prinsloo, 2011; Tait, 2018). Such trends provide potential opportunities for higher education students to learn from institutions based around the world without ever leaving “home.” In this regard, it has been reflected that some of the underlying values of ODDE – such as openness, increased participation, or equity in access – converge with the recruitment of international distance students through extending intercultural learning opportunities across geographic borders (Pumela, 2012).

Although data about the number of students who participate in ODDE internationally are not systematically collected globally, there is evidence of its prominence in the higher education field. For example, the growing prevalence of open universities around the world (Tait, 2018) provides greater possibilities for international engagement through the enrollment of students from other countries. Other distance-based institutions have expanded their international reach; one example is the University of South Africa, which enrolls around 29,000 international students based in 90 different countries (Mittelmeier, Rienties, Rogaten, Gunter, & Raghuram, 2019). Other more limited country-specific data shows a similar picture, such as in the UK, where data from the Higher Education Statistics Agency (HESA, 2021) highlight that over 400,000 students enrolled in a British institution are based outside the country. These trends are likely to increase alongside growing interests in ODDE following the COVID-19 pandemic, whereby restrictions on international student mobility positioned international distance learning as a “panacea in a time of crisis” (Dhawan, 2020, p. 6). This had led to questions about whether such modes are the way forward for international higher education, with some arguing that we might move towards a “post-mobility world” (White & Lee, 2020) through the increased use of ODDE across borders.

This chapter reflects on the “third spaces” that ODDE creates for higher education, whereby students no longer must choose between relocating “abroad” and remaining “at home” due to the rising prominence of online and distance programs across borders. Within this, one particular notion in need of reimagining under the context of ODDE is that of international students. After all, existing tools or definitions for conceptualizing who “counts” as an international student are

disrupted by removing geographic mobility from the equation. This chapter unpacks these complexities by bringing together existing definitions of international students in higher education and highlighting where they are problematic in light of ODDE. The second half of the chapter reflects on the ways that experiences may differ between international students in face-to-face context and international distance education, arguing for a need to see each group's experiences as distinct. Framing this argument is the concept of "internationalization at a distance," in which attention is turned to next.

---

## Introducing Internationalization at a Distance

Prior research on international students and internationalization in higher education has classically organized activities into two categories: internationalization abroad and internationalization at home (Knight, 2004). On the one hand, internationalization abroad is typically framed through the lens of mobility and the movement of students, staff, or programs across geographic borders (de Wit, 2013). On the other hand, internationalization at home focuses on developing international and intercultural dimensions into existing provisions "at home," primarily for the benefit of home students who are not internationally mobile (Crowther et al., 2000).

However, ODDE has created new forms of internationalization that are difficult to classify within either category, particularly considering the increased opportunities for learning across international borders. In online and distance learning, for example, students can learn through the educational approaches of a country based "abroad" all while remaining "at home." For instance, a student may live in the USA and enroll through online distance education in an institution based in Brazil without relocating to that country. Such a learning experience would differ from the education obtainable within a student's own country of citizenship or residence, considering that issues such as the curricula and pedagogy are influenced by the culture, history, and educational values of the places where they are developed.

One way to frame international students' experiences under such circumstances is through the lens of "internationalization at a distance," a third space conceptualized within the existing dichotomous framework of internationalization (Mittelmeier et al., 2019; Mittelmeier, Rienties, Gunter, & Raghuram, 2021b). Internationalization at a distance is distinct from internationalization abroad (which assumes geographic mobility) and internationalization at home (which assumes affiliation with an institution "at home"). This concept can be defined as:

"All forms of education across borders where students, their respective staff, and institutional provisions are separated by geographical distance and supported by technology." (Mittelmeier et al., 2021b, p. 269)

Internationalization at a distance, then, includes students who are geographically immobile (at least for the express purposes of academic study); they remain "at home" while simultaneously learning from an institution located "abroad." In this

way, internationalization at a distance may provide alternatives to geographic mobility, as argued by Breines, Raghuram, and Gunter (2019), by providing avenues for students *not* to move. After all, the opportunities to obtain a degree from an international institution are expanded via ODDE through increased access to universities around the world without the necessity of crossing national borders. This conceptualization was intended to recognize that what is mobile under ODDE is not necessarily people but rather a mobility of knowledge and ideas. This broadens the space that is occupied by institutions internationally, as universities' student reach is expanded beyond their own campuses or national boundaries under ODDE.

This shift requires new considerations about what constitutes an international student, particularly when typical markers of difference – mobility, visas, and citizenship – may no longer apply or hold the same meaning in a more fluid online international space. In face-to-face contexts, for example, the designation of students as either “international” or “home” is often a question of place: home students as those already “here” and international students as those who are from “there.” But these designations (already oversimplified and debatable – as expanded on below and in Jones, 2017) start to lose their meaning when institutions themselves begin to transcend national boundaries. Such situations raise a complex question, which will be addressed next: who, then, is an “international student” in ODDE?

---

## **Problems with Defining “International Students” in ODDE**

Within ODDE, complications arise when one attempts to narrow down who “counts” as an international student, considering many of the categorizations typically used in face-to-face contexts are made more complex in internationalization at a distance. For example, international distance students are typically not eligible for student visas and are not usually geographically mobile for the purposes of education. International distance students, therefore, transcend the existing binary classification of student identities as “home” or “international.” This section illuminates these issues, particularly in reflection of how international students are conceptualized and defined globally and how such approaches may make problematic assumptions about their underlying mode of study.

### **Defining International Students According to Mobility**

Many definitions of international students focus on their mobility across national borders. For example, one prominent international higher education data source is the UNESCO Institute for Statistics (UIS), which defines international students as those who “have crossed a national or territorial border for the purpose of education and are now enrolled outside their country of origin” (UIS, 2021). The inclusion of the verb “crossed” within this definition highlights assumptions about the movement and mobility of students from Country A to Country B. In this regard, the OECD (2021) highlights that more than five million students worldwide are currently

geographically mobile for the purposes of higher education. However, one distinctive quality of ODDE, as often perceived by students, is that it increases opportunities to obtain a degree abroad without being mobile (Breines et al., 2019). This also means that many sources of international data about international students fail to capture or record the number of international distance students studying via ODDE. One result is that, at present, there is no systematic global data collected about how many students study internationally via ODDE and there is no clear international picture of this trend over time.

### **Defining International Students According to Visa Status**

Another common definition of international students focuses on visa status, which, in turn, also assumes international mobility for the purposes of study. The OECD (another prominent data source about international students), for example, defines international students as “those who received their prior education in another country and are not residents of their current country of study” (OECD, 2021). This is similarly defined by the Migration Data Portal (2021) as students who “typically hold a non-resident visa status (sometimes called a student’s visa) to pursue a tertiary degree (or higher) in the destination country.” Such definitions assume that international students are temporary visa holders in the country of their enrolled institution but are not permanent residents or citizens.

These arguments are problematic in the case of internationalization at a distance. In many countries, for example, distance learners are not eligible for student visas and are not granted rights for temporary residency (although a systematic global analysis of this is suggested for future research). This might be viewed through multiple lenses, as on the one hand, it could be argued that internationalization at a distance transcends existing national borders by allowing knowledge and learning opportunities to permeate geographic barriers. Yet, on the other hand, an alternative perspective is that internationalization at a distance perpetuates existing barriers to movement by closing off opportunities to be mobile that may have been possible via face-to-face learning arrangements. Thus, defining international students according to visa status falls into the same trap of assuming geographic mobility, of which international distance students do not or are not eligible to partake.

### **Defining International Students According to Geographic “Otherness”**

Beyond mobility and visas, discourses about international students tend to label them according to what they are not: permanent residents or citizens of the country from which they study. For instance, ODDE and other higher education researchers frequently label international students as those who are simply based abroad – a binary opposite of home students. However, such definitions are rooted in problematic categorizations of “us” and “them,” lending to tendencies for international

students to be systematically “othered” or stereotyped (see, e.g., Moosavi, 2021). On a conceptual level, such labelings of international students in ODDE (and beyond) create segregated social containers that seek to divide individuals according to their perceived sameness or difference in relation to the country where their institution is based (Dervin, 2011). Thus, there are underlying, unspoken assumptions behind defining international students as “not home” that reveal (often problematically) who international students are expected to be or what their difference is expected to mean.

Defining international students according to their perceived geographic difference is also problematic on a more practical level in ODDE. One example is expatriate students, who may study at a distance from an institution based in their country of citizenship while they are living abroad in another country. For example, in research on international distance students at the University of South Africa, it was found that a significant number of “international students” were actually South Africans who were living abroad (Mittelmeier, Gunter, Raghuram, & Rienties, 2021a). This form of internationalization back home outlines a blurry gray area, where such students are geographically distant from their institution but presumably possess the cultural and linguistic knowledge or experiences that might be likely from a “home” student (although this cannot be assumed, given the complexity of individual migration experiences and identities).

Another example might be students with prior immigration histories who currently live in the same country where their institution is based, but are not citizens. Such students would not be counted as “international students” under this definition, but their experiences transitioning to learning in a new cultural or linguistic setting may have similarities to those labeled as “international” (as described in more detail in the next section). Although it is impossible to make assumptions about the unique and complex identities or experiences of individuals with various migration histories, these examples demonstrate the ways that geography cannot always be assumed to represent internationality and that there are limitations to simply dichotomizing “here” and “there.”

## **Problematic Assumptions of Binary Definitions more Broadly**

As outlined above, there are practical and conceptual problems with labeling international students in ODDE. At the same time, it is important to reflect on how binaries of “home” and “international” are problematic on a more general level, including in face-to-face learning spaces (see, e.g., Jones, 2017). This tendency to refer to simple binaries of “international” or “not international” fails to capture the plurality of individual identities that go beyond citizenship, including students’ cultural, ethnic, racial, and linguistic diversities. One outcome of this is that students who are labeled as home students may identify with “the international” in multifaceted ways left unseen by their universities. After all, the ways that individual identities might align with “international-ness” is potentially infinite and oftentimes too complex to cleanly label or categorize.

The broad labeling of “international students” also problematically homogenizes a group of students who possess significant diversities through assumptions that there is a single, collective “THE” international student experience. For example, in

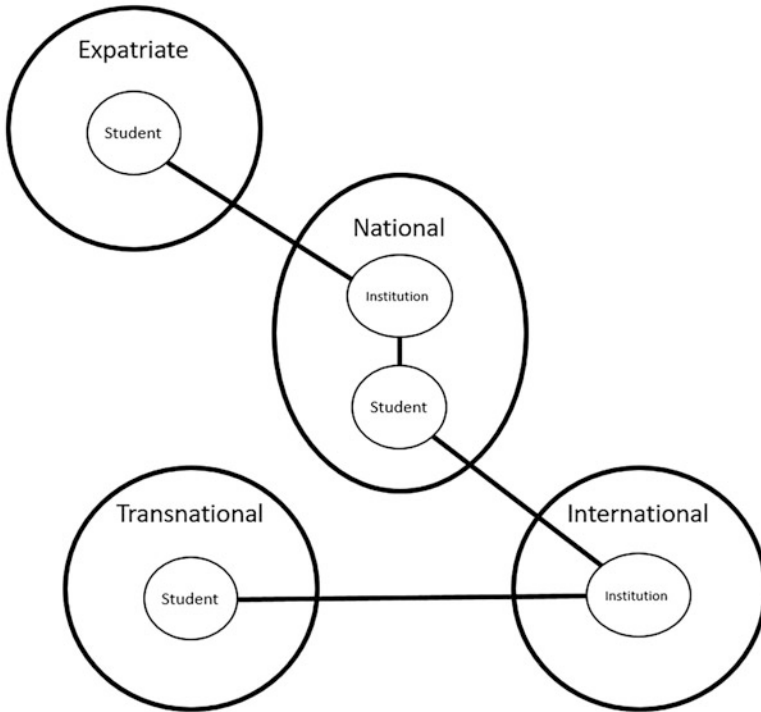

a systematic literature review of research in the UK about pedagogies with international students, a full 57% of 49 included studies failed to include any other demographic information about participants beyond that they were categorized as international students (Lomer & Mittelmeier, 2021). This means that international students' intersectional identities are often ignored, both in research and in practice, by assuming their noncitizen status is a meaningful marker of diversity that signifies a shared experience. Although the intersections of international students' experiences and other identity markers such as race (Bardhan & Zhang, 2017; Madriaga & McCaig, 2019) or gender (Song, 2020) have received more recent attention, these reflections remain limited, particularly in research about ODDE.

One outcome of this homogenisation is that intranational differences are frequently ignored through latent assumptions that nations are homogeneous and culture is static (see, e.g., the argument in Lomer & Mittelmeier, 2020). For instance, claims are often made about "THE" Chinese learner (Carr, 1999; Gu & Schweisfurth, 2006), which fails to recognize that China has 55 recognized ethnic minority groups and dozens of regional language varieties. Such homogenization lends to limited reflection for international students on issues such as widening participation (Gayton, 2019), despite significant differences in their classed experiences in ODDE (Breines et al., 2019). It is also reflected through a pervasive deficit narrative, whereby international students are frequently assumed to, as a collective group, "lack" certain skills for successful study or "struggle" with integration into their host communities (Lillyman & Bennett, 2014; Moosavi, 2021).

## Defining "International Students" in ODDE

These critical reflections form a backdrop for discussing who "counts" as international students in ODDE settings, demonstrating that the labeling of international students is complex and results in problematic outcomes even in face-to-face settings. As indicated in the previous sections, many of the assumptions underpinning the binary labeling of international students are made even more complex in ODDE, namely, through assumptions around mobility, visa status, and citizenship or residency. In reflecting on this plurality, Stewart (2017) has provided a helpful model which categorizes the multifaceted ways that students study through internationalization at a distance. This includes four distinct categories of students:

- **National:** Those who study online or distantly from within their own country of citizenship.
- **International:** Those who study online or distantly from an institution abroad while based in their own country of citizenship.
- **Transnational:** Those who study online or distantly from an institution abroad while living in a different country that is not their country of citizenship.
- **Expatriate:** Those who study online or distantly from an institution in their own country of citizenship while they are living abroad elsewhere.

**Fig. 1** Visual mapping of student categorizations in internationalization at a distance

This is visualized in Fig. 1, which helps demonstrate the complexity of the ways students can be categorized in internationalization at a distance.

Although it could be argued that such attempts to categorize students fall into similar traps of oversimplification of individual identities, this model does help demonstrate the multifaceted ways that students may engage within and across national boundaries in ODDE. This also demonstrates a need for researchers and practitioners to purposefully reflect on how they are categorizing “international students” in their work, with explicit justification and reflection on the underlying assumptions of taking such approaches.

Additionally, these issues highlight challenging gaps in systematic knowledge about the scope of internationalization at a distance, given that definitions of international students vary between data controlling bodies and that ODDE students are not systematically included or differentiated in major international student datasets. Yet, there has been limited recognition of the distinct experiences between students in these two groups, which necessitates their division in the data. Relatedly, there is also more limited knowledge about international distance students’ experiences in ODDE settings, particularly compared to the wealth of research about this in face-to-face contexts, which is drawn into attention next.

## Understanding International Students' Experiences

In face-to-face settings, international students' social, cultural, and academic experiences have received much interdisciplinary research attention over the last few decades (see, e.g., a review by Kesnold Mesidor & Sly, 2016). For instance, it has been outlined that there are over 200 publications each year about the broader internationalization of higher education (Tight, 2021), of which research about international students plays a significant role. Although a full review of the literature in face-to-face contexts is beyond the scope of this present chapter, it is worth recognizing the established knowledge that international students may experience significant and multifaceted transitions while living and learning in a new cultural context (Jindal-Snape & Rienties, 2016). International students' transitions can be defined as "an ongoing process that involves moving from one context and set of interpersonal relationships to another" (Jindal-Snape & Rienties, p. 2). Thus, much research about international students has focused on their experiences as temporary sojourners, such as their sense of agency (Tran & Vu, 2018) or identity development (Bond, 2019) in new cultural and linguistic settings.

One key area of this research focuses on academic transitions and support, particularly international students' experiences with and perspectives towards learning in a new cultural context (e.g., Lillyman & Bennett, 2014). One extensive topic within this has been linguistic transitions and the ways that international students develop their knowledge of academic language (for instance, Dippold, Heron, & Gravett, 2021). Other work has focused on pedagogies, for example, by considering experiences of intercultural group work, including the social complexities of teamwork between peers from different countries (such as Reid & Garson, 2017). There have also been reflections on developing more explicit support provisions for international students, such as through strengthened approaches to feedback (Chew, 2014). Nonetheless, it has been previously argued that research about pedagogies with international students tends to be methodologically limited or focus on single-site case studies within lecturers' own practices, meaning there is significant room for development on this topic in the future (Lomer & Mittelmeier, 2021).

It is also recognized in the existing literature that geographic mobility means the uprooting of students from their established social support networks, often requiring international students in face-to-face settings to navigate social complexities and develop new support structures (Jindal-Snape & Rienties, 2016). As such, much research has also focused on international students' experiences developing social friendship networks (e.g., Rienties, Hélot, & Jindal-Snape, 2013). For example, Kudo, Volet, and Whitsed (2020) have conceptualized a three-stage ecological model for how students from different cultures develop friendships in higher education. It has been acknowledged that further support is often needed for international students' social transitions through the building of new social resources and networks (Arthur, 2017).

Despite the proliferation of research on this topic, it has been argued that much of it tends to be under-theorized, pragmatic, and developed through a deficit lens

(Lillyman & Bennett, 2014). For example, a discourse analysis of research about internationalization more broadly found limited criticality about underlying issues of power, privilege, and inequality in international education engagements (Mwangi et al., 2018). However, there has been a recent shift towards what has been called “critical internationalization studies,” which seek to problematize underlying issues of “the continuation of enduring patterns of Eurocentric knowledge production, exploitive relationships, and inequitable access to resources” (Stein, 2019, p. 3). For work with international students, this means a growing recognition of the ways that they may be stigmatized and unfairly depicted through deficits (Moosavi, 2021). There is also a growing recognition for social inequalities, such as how international students’ experiences may be racialized (Madriaga & McCaig, 2019). Thus, the subfield is slowly shifting towards critical recognitions of existing barriers and the framing of international students as “epistemic equals” (Hayes, 2019) – although Stein (2019) argues such approaches remain on the margins and require greater engagement.

Linking this back to ODDE, the research about international students in face-to-face contexts is shaped by mobility and the ways that immersion in a new country or culture impacts individual experiences. This work focuses on the impact and outcomes of being – physically, socially, and emotionally – uprooted and removed from existing known support systems. The social experiences of international students in face-to-face contexts also exist in spaces where difference is made more visible and is informed by everyday micro-interactions. Thus, there is caution needed in assuming the transferability of findings about international students in face-to-face contexts to the experiences of learning through internationalization at a distance. These, it can be argued, are two entirely distinct learning and social experiences, despite the tendency for some literature to conflate the two through the shared terminology of “international students.”

## **Understanding International Distance Students’ Transition Experiences**

The lack of geographic mobility in ODDE means that the notion of “transition” takes on different meanings for international distance students. As international distance students remain for the most part “at home,” this means that their social and cultural structures remain in place, limiting the sense of “uprooting” that is commonly experienced by international students in face-to-face contexts. International distance students also typically remain within their own cultural and linguistic settings, meaning there are fewer life transitions experienced compared to those inherent to migration. However, this raises other potential questions, considering international distance students do not have opportunities to “immerse” themselves in the cultural and linguistic settings of their host institution (Ramanau, 2016) and may encounter greater barriers of assumed knowledge. Some authors, for example, have argued that international distance students may have more limited understandings about the learning expectations of a country that they have less experience with or have

perhaps never visited (Zheng & Kenny, 2010). For instance, research has reflected that international distance students may have fewer opportunities to engage with acquiring socially situated language and vocabulary (Fenton-O’Creevy & van Mourik, 2016).

Thus, it is recognized that transitions do still exist in ODDE and that international distance students still encounter new educational norms and values while undertaking a degree abroad (Ramanau, 2016). This may include transitions to using new technologies or encountering uncertainties about expectations for new communication mediums. For instance, research has reflected on cultural differences in online communication styles that may impact learning experiences (Zhang, 2013). This may help explain findings in a wide range of studies about international students’ perceived “silence” or lack of engagement with online tools such as forums (see, e.g., Harrison, Harrison, Robinson, & Rawlings, 2018). This has led some to argue for a need for greater intercultural awareness in international distance settings and purposefully designed transition supports for international distance students (Kung, 2017).

Other researchers have considered the extent to which physical distance may create additional hurdles for international distance students. For example, in comparing the experiences of home and international distance students, Gemmell and Harrison (2017) found that international distance students more frequently encountered technical troubles with accessing required resources for study. This links to findings from Mittelmeier et al. (2019), where it was identified that some international distance students found it difficult to access required study materials, influenced by global inequalities in access to high-speed internet. Administrative barriers, such as the payment of tuition fees in foreign currencies (Raghuram, Breines, & Gunter, 2020), can also add additional stressors to routine student activities. Thus, there are practical considerations for international distance in addition to pedagogic reflections.

Previous research has highlighted the sense of social isolation or loneliness that distance learners may feel in the absence of tangible campus spaces for networking (Kaufmann & Vallade, 2020). In this regard, international distance education may create more hurdles for social involvement, though issues such as limited student networks outside of the host institution’s country or time zone differences. For example, Madge et al. (2019) found that some international distance students relied on informal support networks through social media to develop a sense of belonging and community with peers. Yet, despite perceptions of limited social engagement, international distance students in some contexts have been shown to still hold a strong sense of belonging and appreciation for their institution (Mittelmeier et al., 2019), prompting consideration for future research about the meaning that distance learning may hold for international students’ lives.

While this section is not intended to provide a full review of the research about international distance students’ experiences (see, e.g., Lee & Blight, 2019; Stewart, 2019), the research conducted on this topic thus far does start to paint a picture of the complexity of international distance students’ experiences. This also demonstrates the ways that the experiences of international distance students are distinct from

international students who are geographically mobile, considering the significant differences in their practical environments and the ways that distance shifts their engagement with their institutions. Therefore, these two groups should be distinct in the literature, allowing researchers to focus on their individual situations and transitions. Yet, there is much left unknown at present about international students in ODDE, which is summarized next.

## Gaps and Challenges in Existing Knowledge

Knowledge about the experiences and contributions of international distance students has remained relatively under-research and under-theorized in comparison with other aspects of ODDE. For example, in a recent synthesis of trends in research about distance education by Bozkurt and Zawacki-Richter (2021), there was no mention of international distance education or international students. In the research about international students, a systematic review by Yemini and Sagie (2016) noted a growing shift towards research in online spaces, but these comprise only a small number of studies and are clustered together with educational technology more broadly. Thus, there is a need for greater synergy between these two topics, drawing upon how these dual influences converge for international distance learners.

In particular, research about international distance students remains starkly more limited in comparison with the in-depth scholarly understandings about their experiences in face-to-face settings. Given the aforementioned differences in experiences between international students studying in face-to-face versus distance contexts, this represents a significant gap in knowledge against the backdrop of the growing prevalence of ODDE across geographic borders. This issue is exacerbated by a lack of systematic global data about the size and scope of international distance education. Altogether, critical empirical and conceptual knowledge about international students in ODDE remains an area worthy of scholarly attention in the future.

It has been previously argued that research about international students is often methodologically limited to case study research within researchers' own teaching practices (Lomer & Mittelmeier, 2021). Research about international distance students also falls into this trap, whereby much of the existing research considers the usage of highly contextualized pedagogies or technologies, primarily focusing on the use of different online tools. On the whole, there are few examples of longitudinal, cross-institutional, or comparative research on this topic (as, e.g., Gemmill & Harrison, 2017). There are also few studies that have compared issues of pedagogy or student experience between ODDE and face-to-face teaching contexts, meaning there is limited understanding of the specificities of their distinctiveness (although this has been in focus for home students, e.g., Shu & Gu, 2018).

Another issue facing research in this area is the persistent deficit narrative, which frames international students as lacking particular skills or experiences for success (Lillyman & Bennett, 2014; Lomer & Mittelmeier, 2021). In this way, perceptions of "difference" have commonly led to negative portrayals of international distance students' contributions to online learning environments. This is well described by

Lee and Blight (2019, pp. 159–160), who argued in their literature review about international distance students that “[s]pecific groups of students are positioned as being passive, conformist, uncritical and silent.” Thus, there is a need for research on this topic to position itself more from the perspective of realizing the potential opportunities available, rather than the barriers created, by international distance learning. Engagement with existing critical internationalization theories (e.g., Stein, 2019), for example, can help develop more well-rounded reflections on experiences that are culturally, socially, academically, and geographically nuanced and complex.

---

## Conclusions and Suggestions

This chapter has highlighted the growing role that international distance students play in ODDE and the ways that their experiences are significantly different from international students in face-to-face learning settings. However, knowledge about their experiences is presently limited due to conflicting definitions or categorizations, limited systematic data, deficit narratives, and limited scholarly attention. For example, there has been limited engagement between ODDE research and existing theories and conceptualizations of internationalization and international students. Yet, this represents an important avenue for research moving forward, particularly as ODDE continues to stretch beyond national borders. Thus, the following practical suggestions for researchers and practitioners provide avenues forward for strengthening understandings of this topic:

**Reflect on and explicitly describe chosen categorizations of international distance students.** The issues and ambiguities highlighted in this chapter demonstrate pragmatic needs for ODDE researchers and practitioners to critically reflect on labels and categorizations of (international) students with issues of space and place in mind. On a practical level, this means clearly and explicitly defining what is meant by the label of “international student” and reflecting on what assumptions might underpin such labeling. For instance, critical reflection is needed for addressing the fundamental reasons for labeling and the mechanisms with which this has been undertaken. In most circumstances, the phrases “international distance students” and “internationalization at a distance” are preferred terminologies that can more clearly describe the distinct phenomenon being studied or undertaken.

**Collect and share systematic data about the prevalence of international distance students.** At present, there are no global systematic data collected about the numbers of students who study via international distance education. For data governing bodies, this means work is needed to differentiate definitions of international distance students from international students in face-to-face settings, as their distinct experiences are not currently reflected in the data collected about them. In particular, mechanisms are needed for compiling the numbers of international distance students on a global scale. For individual researchers and practitioners, this means including information, where available, in publications or through public data repositories about the numbers of international distance students in the

institutional context where the research or practice has been undertaken. Together, this can help paint a clearer picture of the size and scale of ODDE across borders.

**Engage with existing critical theories of internationalization.** For researchers, scholarship undertaken in ODDE settings about international distance students tends to frame research through the lens of ODDE without also engaging with the critical conceptualizations developed in the subfield of internationalization of higher education. Relatedly, there is a greater need for research in this area to consider the growing prevalence of critical internationalization studies (Stein, 2019), which seek to engage with the ways that internationalization is politicized and globally uneven. Engagement with this literature also applies to practitioners, considering that there is often limited training available at institutions which focuses on developing interculturally inclusive curricula and pedagogies.

Thus, ODDE research and practice on this topic can develop more complex understandings about international distance students by engaging with the “international-ness” of students’ experiences and reflecting on how broader theories about online and distance education intersect with knowledge about internationalization (e.g., as in Pumela, 2012). In particular, one consideration is the ways that deficits currently frame research and practice with international distance students, through assumptions of experienced challenges or skills perceived to be in lack (Lee & Blight, 2019; Lillyman & Bennett, 2014; Lomer & Mittelmeier, 2021). A helpful starting point for researchers and practitioners who would like to engage more with these ideas is available at the following curated reading list: <https://internationalpedagogies.home.blog/critical-reading-list-for-researchers/>

**For researchers, develop innovative research designs that encourage nuanced understandings about international students.** The conclusion of Mittelmeier et al. (2021b) outlined a list of key questions to guide future research about internationalization at a distance and the experiences of international distance students. In this regard, one critique of the existing research about international distance students is that it tends to be limited in scope, focusing on specific tools, pedagogies, or experiences in single learning contexts. As such, there is space for more methodological and research design innovations that considers, for example:

- Cross-contextual experiences of international distance students, comparing their experiences across disciplines, institutions, or countries.
- In-depth and comparative analyses of students based in different countries or from different backgrounds.
- Comparisons of the experiences of international students in face-to-face and ODDE settings.
- Comparisons of the experiences of students based in the country of the awarding institution and those based in other countries.
- Longitudinal understandings of experiences over time or throughout a program of study.

- Sequential development of learning provisions over time with different cohorts of students.

Such approaches would add more nuances to emerging knowledge about this topic, which remains under-theorized compared to broader ODDE experiences or the experiences of international students in face-to-face settings.

Altogether, this chapter has argued that we presently have limited vocabulary and knowledge in both research and practice for discussing the experiences of international distance students in ODDE who learn under internationalization at a distance. However, international distance students are a growing group of learners with distinct experiences that are characterized by wide-ranging dualities, particularly in their status as both located “at home” while learning “abroad.” The nuances and complexities of such experiences are a growing topic of interest for scholars and a key area of further conceptualization in the work on ODDE to come.

## Abstract

In recent years, efforts to internationalize teaching, learning, and the curriculum using digital media have increased and (higher) education institutions around the world have embraced virtual communication and collaboration to foster and maintain international partnerships. This chapter surveys linkages between international partnerships and curriculum design. Based on concepts and designs that can help to establish virtual joint educational initiatives within the framework of international (institutional) partnerships, this chapter introduces different curriculum design models and their implications for international partnerships in order

**Introduction**

Prior to the Covid-19 pandemic, discussions about international partnerships and the related curriculum design processes mainly focused on how physical mobility could be implemented in on-campus study programs. Not least due to the amount of experiences with online teaching, this focus seems to have changed now in higher education institutions (HEIs). Yet even before the pandemic reached educational settings worldwide, the value of distance education for internationalization processes had been recognized. For some time now, distance learning has been characterized as a relevant element to foster the international connection that underlies higher education in general, because it addresses collaboration and openness between international partners and invites the exchange of ideas without the necessity to travel (Coates, 2020, 41ff.). To better understand the benefits of distance education, it is vital to overcome the negative connotation of the term “distance” and to establish a better understanding of what it means to “be at university” (Bayne, Gallagher, & Lamb, 2014).

Current research on international partnerships draws from these reconsiderations of what it means to have international experiences in one’s studies and allows international partnerships to transfer their insights into their study programs via curriculum design processes. This chapter begins by focusing on concepts and designs that can help to establish joint educational initiatives based on international partnerships. Thereafter, it invites readers to explore curriculum development approaches and thus provides a foundation to initiate new curriculum processes or evaluate existing ones with regard to the involvement of international partners.

Even though most of the examples and studies underlying this chapter derive from the context of higher education, their underlying concepts – especially on the level of curriculum design – are applicable to educational settings in general. Our focus on HEI mainly derives from the fact that more studies on realized international (online) programs exist in this field. Linking this research with findings on curriculum design allows us to focus on those aspects which seem most crucial in successful partnerships: to name and to understand the benefits that the partners wish to achieve together (cf. Eddy, 2010).

## Educational Approaches and Concepts in International Partnerships

In a setting with international partners, curricula can be designed along different axes. Next to double and joint degree programs – with closely aligned curricula in closed consortia that rely on the physical mobility of students as they progress through the curriculum – a number of formats have emerged that situate teaching and learning in virtual, in parts collaborative, settings. These can complement pedagogical approaches to the international (on-site) classroom (Carroll, 2015; Gregersen-Hermans & Lauridsen, 2021) in the context of purposeful Internationalization at Home and thus make international experiences more widely accessible to students (Beelen & Jones, 2015).

This is becoming increasingly relevant, since there has been, as Helm, Guth, Shuminov, and van der Velden (2020) note, “growing recognition of the limited reach of mobility” (p. 92). The Erasmus+ Higher Education Impact Study (European Commission, 2019) observes both accessibility issues and limited diversity among the students who choose to study abroad. In their widely cited definition, Beelen and Jones (2015) refer to Internationalization at Home (IaH) as “the purposeful integration of international and intercultural dimensions into the formal and informal curriculum for all students within domestic learning environments” (p. 7). IaH measures thus explicitly target not only students in more exclusive double or joint degree programs but, most of all, students in rather nationally oriented degree programs. Through the integration of, for instance, case studies and literature from other cultural contexts, comparative angles, local community-based research projects, or service learning projects that touch on global issues, students may further develop their intercultural skills and build a well-founded knowledge of international issues in their discipline. IaH is explicitly not meant to substitute a study abroad but contribute to competence development regardless of mobility periods.

Virtual teaching and learning, especially in collaborative scenarios, have a particular appeal in this regard: They can provide for a more direct access to “other” perspectives and knowledge, enable students to gain insights into teaching and learning in other academic cultures, and foster intercultural teamwork. Moreover, virtual exchange formats hold the promise to boost the internationalization of so-called “underrepresented groups,” i.e., students “who cannot or do not want to be mobile because of their socio-cultural background and status, disabilities and chronic diseases, family and parental obligations, financial issues or language proficiency” (European Students’ Union & Erasmus Student Network, n.d.).

In this part of the chapter, frequently used formats will be surveyed and potential shortcomings as well as opportunities for international partnerships and curriculum design will be spotlighted.

## Virtual Mobility

Virtual mobility (VM) offers – which may be understood as a loose form of international collaboration – have surged at institutions that would otherwise strongly identify as campus-based universities. In *Virtual Internationalization* (2020), Bruhn traces the development of VM: Already in 2002, she notes, Wächter anticipated the transformation of higher education toward flexible learning that could take place independent of time and location and “almost borderless” choices (qtd. in Bruhn, p. 24) and its potential for international activities, such as marketing and recruitment and transnational education, was soon recognized (ibid.). VM is a term commonly used to refer to students and academics in higher education studying or teaching at another institution outside their own country for a limited time without physically leaving their home. In practice, this entails following one or several online courses from a host university and acquiring credits that are recognized at the home university (van Hove, 2021, n. p.). VM therefore allows for access to perspectives and knowledge not available on the home campus, exposes students to another academic culture, as well as provides them with the opportunity to build a distinctive profile in their curriculum.

To this effect, VM can play an important role in international partnerships when it comes to aligning curricula more closely, sharing resources, and complementing each institutions’ profile. This may be particularly interesting in the context of specialized degree programs or so-called “small subjects,” such as classical archaeology or biostatistics, that only attract relatively small numbers of students and operate with limited resources. In the context of evolving partnerships, VM may also serve as a testbed for the development of international joint degree programs. Against the backdrop of the EU learning mobility benchmark of 20% mobile students as well as diverse national mobility benchmarks, VM is expected to play a significant role in the near future, since student taking part in VM offers can be formally enrolled as exchange or guest students (Joint Research Centre [European Commission], Sánchez Barrioluengo, & Flisi, 2017). This status, together with the credit transfer from host to home institution, can prospectively count toward internationalization benchmarks (van Hove, 2021, n. p.).

However, it should be noted that virtual mobility hardly enables intercultural dialogue (Reiffenrath, de Louw, & Haug, 2020, n. p.). Van Hove (2021), too, stresses that the international dimension of the learning settings that emerge in the context of VM offers often remains untapped. He goes as far as to state that VM “is in no way guaranteed to be a useful internationalisation experience . . . [T]aking courses abroad and transferring credits are the traditional formal features of student mobility, and if you take the physical mobility out of the equation, this is what you are left with” (n. p.). He holds and argues that the emphasis on “mobility” is in this case misleading. During periods of physical mobility, students to a large extent develop competences not in the context of the formal curriculum they partake in at the host institution, but through immersion and the offers made available to them beyond the classroom (ibid.). What follows from van Hove’s argument is that both HEIs and policymakers should be keenly aware of the limitations of VM when distributing funding and recognizing international activities and academics’ engagement in international partnerships.

## Virtual Exchange (VE) and Collaborative Online International Learning (COIL)

The intercultural dialogue that is missing from VM formats takes center stage in so-called virtual exchange (VE) scenarios. The most comprehensive and most commonly cited definition of virtual exchange is one that has emerged in the context of the EVOLVE project (<https://evolve-erasmus.eu/>) funded by the European Commission. Here, VE is referred to as

“technology-enabled, sustained, people to people education programmes or activities in which constructive communication and interaction takes place between individuals or groups who are geographically separated and/or from different cultural backgrounds, with the support of educators or facilitators. Virtual Exchange combines the deep impact of intercultural dialogue and exchange with the broad reach of digital technology” (EVOLVE, 2021, n. p.).

Like VM, VE has attracted considerable interest during the Covid-19 pandemic. Yet virtual exchange is by no means a recent phenomenon. In his seminal paper *From Telecollaboration to Virtual Exchange*, O’Dowd (2018) traces the development of approaches to virtual exchange. Already in the 1990s, just a few years after the emergence of the Internet, international virtual academic collaborations were initiated in language learning classrooms in order to enable students to interact with native speakers and create semi-authentic communication settings. Incarnations of such international teaching and learning partnerships have commonly be referred to as telecollaboration (Belz, 2003), e-tandem (O’Rourke, 2007), telecollaboration 2.0 (Guth & Helm, 2010), or online intercultural exchange (O’Dowd & Lewis, 2016). These formats use technology to connect classes across borders and facilitate asynchronous and/or synchronous communication. Often, they are bilingual with language learners and native speakers, respectively, on each side of the partnership. Under the guidance of their teachers, who serve as languacultural experts (Belz, 2003, p. 2), the students engage in joint projects or tasks: They might produce a presentation, website, media campaign, or other product together based on a comparison of their cultural contexts, analyze parallel texts, or conduct ethnographic interviews followed up with reflective essays (O’Dowd, 2018). These virtual collaborations thus serve the purpose of fostering students’ foreign language skills and increasing intercultural competences (cf. Belz, 2003, p. 2). As such, they are integrated into local foreign language programs that offer a room for preparation and reflection.

Yet also beyond the area of foreign language education, discipline-specific virtual collaboration formats have emerged. O’Dowd subsumes these under the category of the “shared-syllabus approach” (O’Dowd, 2018, p. 14). In 2004, Jon Rubin established the COIL – collaborative online international learning – methodology at the State University of New York (SUNY) and their network of international partners, which nowadays is one of the largest global VE networks (<https://coil.suny.edu/global-network>). COIL has become a widespread practice and the term is now used shorthand for the practice of “connecting two or more classes of similar course

content in different countries” (O’Dowd, 2018, p. 14). As quite explicitly stated in the term, collaboration, and with this an exchange of ideas and perspectives from different cultural contexts, is at the heart of this practice. The intercultural exchange begins with the academics who at the onset of the collaboration need to negotiate what and how they are going to teach. Subsequently, they design units together that aim at “breaking the ice” (initiating contact between the two classes and enabling the formation of small, intercultural teams), comparing and contrasting perspectives, connecting and collaborating in the context of a joint group project (along with a presentation), and finally reflecting on the experience. Often COIL partnerships run for 6–10 weeks in order to accommodate differing semester schedules and are integrated into the context of a semester-long course at the respective institution. Their design principles have the potential to be extended to interdisciplinary contexts.

In order to be sustainable, all of these formats require strong international partnerships as their basis. Especially in the context of VE, frictions between bottom-up initiatives and top-down institutional visions emerge and can significantly affect how institutions can move forward with international virtual academic collaborations. Formalized, long-term international partnerships are central in creating a framework in which joint or shared online courses may be sustained and eventually upscaled. However, most international partnership agreements have been negotiated for the purpose of physical mobility of students and staff and may not as easily accommodate virtual collaboration. Moreover, the success of VE in particular hinges on mutual trust between the academics who facilitate it, who may have longstanding professional relationships established during joint research, previous employment, or mobility periods. The connections that individual academics harness for virtual collaboration may therefore not always be in line with their institutions’ strategic international partnerships. HEIs need to be mindful of these frictions in their efforts to connect bottom-up activities and leadership agendas so as to recognize (and ideally award) individual efforts while at the same time strengthening institutional visions in internationalization.

## **Curriculum Design: The Backbone of International (Online) Programs and Partnerships**

This chapter addresses the topics of curriculum and curriculum design on two levels: first, on the level of study programs, and second, on the level of single courses. The aim is to substantiate that collaboration and communication on both levels are crucial for international partnerships in higher education and especially so when the academics involved seek to implement virtual exchange or other distance education formats.

Before elaborating on this in more detail, it is necessary to stipulate some basic thoughts regarding the main terms in this section: the term “curriculum” and the term “curriculum development.” Lau (2001, p. 31) stresses that both terms

“[...] are problematic themselves as they imply two well-defined stages – the stage of development and the stage where the curriculum is completed. In fact, there is no line separating the two. Curriculum development is not an entity that stops before going into classrooms and curriculum is not a package that stops developing in the classrooms. It is a continuous process of constructing and modifying.”

Therefore, in this chapter, curriculum and curriculum design are understood as overlapping and context-related educational frameworks that are continually changing due to social, physical, economic, and cultural environments (O’Neill, 2015, p. 12). Both require ongoing and detailed context analysis, not only regarding their inherent assumptions about how teaching and learning works (in higher education) but also concerning the roles that they attribute to those who teach, those who learn, and the relationship of both (Young, 2014, p. 7). Even though such an analytic perspective on curriculum (design) is advisable in all educational contexts, it seems even more relevant in international partnerships that seek to connect (elements of) their curriculum virtually or through student mobility.

Several theories and models of curriculum design can be used to approach this complex issue. In this chapter, the most prominent of them will be introduced and discussed regarding their ability to include context-sensitive aspects that might be relevant for (virtual) joint programs.

### **Curriculum Design on the Program Level: Common Models**

Curriculum design models can help to develop a study program to structure and to fill it. Even though it is rather common that several models can be used to (further) develop a study program, it is relevant to understand their different perspectives as well as their benefits. All of these models can offer orientation to those involved in curriculum design processes, because they provide the common ground based on which programs’ content, its outcomes, and its elements can be discussed and reflected. Apart from this benefit, these models may differ immensely in their approach and thus lead to different challenges for cooperatively planned (international) programs. Especially so when the joint programs are meant to be conducted online. In addition to the more content- and outcome-focused models that will be described below, curriculum design processes for distance and online education need to consider questions of how to provide students of another HEI access to one’s virtual learning environment as well as the challenges caused by different time zones or varying data policies in the students’ home regions. Hence, the levels of “technology, pedagogy, and learner community” (Chugh, Ledger, & Shields, 2017, p. 10) should be inherent part of a curriculum design process as soon as its main structure is set. Three model types to develop such a main structure will be introduced in the following.

The first model type presented here are the so-called process models (Kelly, 2004; Knight, 2001). These models follow the conviction that if you get the “ingredients” right in a curriculum (O’Neill, 2015, p. 29) the right outcome will follow. The focus while designing the elements of a study program lies on the possible learning paths of the students and on their study process.

In process models, orientation for the development of a (new) curriculum derives from the attributes and features which an institution marks as relevant for itself (Leask, 2001). For example, a process model can closely connect to the level of strategies and policies of each institution, hence it applies an *organizational perspective*. It also applies a *program perspective*, because it focuses on the level of academic activities that are possible and desirable in a specific setting. Such a context-sensitive approach holds possibilities for an individual HEI, as it might foster the effectiveness of internal strategies (e.g., a mission statement for teaching and learning or a virtual mobility policy). Yet, as Leask (2001, p. 101) points out, “although it is logical that what is embedded in policy and administrative systems should also be embedded in and integral to the academic practices of an institution, this convergence is not always easy to achieve.” With regard to international partnerships seeking to implement virtual exchange programs or modules, the application of process models can be even more laborious. Here, not only assumptions about teaching and learning must be somehow aligned, but also the strategic orientations of the institutions involved. If such a model is applied, the desired learning journeys, which are possible in campus-based programs compared to virtual study programs, should be taken into consideration as well (Chugh et al., 2017, p. 7) and thus add another perspective in the development process. Since this can be challenging, international reforms in education (e.g., the Bologna reform in Europe) apply models that offer an easier starting point and allow for easier comparability: the so-called product models.

Product models focus on “developing and communicating transparent outcomes” (O’Neill, 2015, p. 28). They seek to define the intended outcomes of a study program and then use this focus to design necessary elements to reach these outcomes within the curriculum structure. Since product models closely relate to management ideologies – “planning, organising, leading and controlling” (Lau, 2001, p. 33) – they are being criticized despite their focus on comparability. Such critique (mostly by postmodern perspectives) emphasizes that these models suggest that the process of curriculum planning can be neutral (ibid.). Yet this is hardly possible, as becomes evident when characteristics of the outcomes of a study program are critically examined. Because, when talking about outcomes – or rather intended learning outcomes – it is necessary to differentiate between different levels of outcomes: individual courses, modules, and programs (Hussey & Smith, 2008). Moreover, and possibly even more relevant in the context of international partnerships, the desired outcomes among the individuals who are involved will differ. Those who design programs or modules might intend to reach other goals than the teachers who design the courses, and yet again, their intended outcomes most probably will differ from those of their students. Thus, when applying a product model, “care should be taken not to be overly prescriptive when writing learning outcomes” (O’Neill, 2015, p. 28; see also Hussey & Smith, 2003), especially so when a program addresses an international target group and aims at intercultural competence development in an online setting such as VE. With respect to international partnerships, however, the benefits of product models remain, since they offer an explicit starting point to discuss possible directions of a joint endeavor.

A third type of models that is particularly promising with regard to module-based international partnerships like virtual exchange are the so-called postmodern models (Doll, 1993). These seek to apply a less fixed and more relationship-based approach to designing curriculum and demand “that power needs to lie in the hands of teachers and learners” (Lau, 2001, p. 38). It focuses on the interactive and negotiating nature of educational processes and tries not to emphasize prescribed plans or fixed objectives. In doing so, postmodern models value the human aspects that influence curriculum design processes, such as attitudes, feelings, and values (Ornstein & Hunkins, 2018). Such approaches might be challenging when they are applied in the design of joint degree programs in higher education. Still, they can be exceptionally valuable for international online curricula, since they urge those who set up a study program to actively pay attention to the social contexts in which they will be realized and thus pay close(r) attention to the intended target group. Which students should be attracted with the program? Which motivations could drive their involvement in an online program instead of a campus-based program (e.g., family-related or financial aspects)? How might the social contexts of the students relate to the contexts of the institutions that offer the program? Postmodern models can help to integrate elements in the curriculum that address these aspects and thereby provide incentives for teachers and students to include these issues in their interactions.

As mentioned above, it is not uncommon to apply different models at different stages during a curriculum design process. When deciding on which model type international partners should start such a process, they might find it useful to consider the overarching characteristics of these models as introduced by Ornstein and Hunkins (2018). Will they prefer a more subjective and learner-centered approach (a so-called *nontechnical approach*) or rather an approach that focuses on structuring the learning environment and thus seeming more logical and efficient (a so-called *technical approach*) (O’Neill, 2015, p. 31)? Which will help them better to design a new program? Which might be more fruitful to evaluate it? Whichever model educational institutions (and partners) decide to use, it is crucial to keep in mind what each curriculum should focus at the following: to create a framework that fosters education by giving room for specific teaching and learning experiences to emerge. Table 1 offers orientation on the purposes and rationales for the application of these different models.

Introducing these models exemplifies why curriculum development in general is a complex issue, and even more so for international (online) programs. Furthermore, when preparing such a new distance curriculum “[i]t is important to keep in mind that a great deal of the work in teaching at a distance may occur prior to the start of the course” (Restauri, 2004, p. 32). Here, experiences from online distance education elucidate that institutional support is crucial when implementing such programs. Individual approaches, in which the responsibility to design and facilitate online courses solely lies with the teachers, may cause them to “falter,” if they do not have enough time to prepare the educational environment (Restauri, 2004, p. 33). In contrast to this, collaborative approaches (ibid.) are said to offer sufficient support structures from the HEI (e.g., through instructional designers or educational technologists) and thereby ensure that teachers can concentrate on designing course

**Table 1** Focus, benefits, and challenges of different curriculum design models

Model type	Main focus	Benefits for international online programs	Challenges for international online programs
Process models	Focus on content and activities; seeks to rely on the inherent strengths of a HEI	Allows for discussions on institutional strategies and policies as foundation to develop a curriculum together	Finding a common ground can be harder, especially regarding expectations on where and how to conduct single modules or courses
Product models	Focus on outcomes; seeks to make the aims of a program transparent and achievable	Offers a starting point to enter discussions about future joint programs	Risk of disregarding the variety of motives and hope for outcomes that students and teachers bring to class
Postmodern models	Focus on relationships and human aspects; seeks to provide space for interactive and flexible educational processes	Impulse to consider the social contexts of the students and to integrate elements in the curriculum that address this	Partner institutions should be well aware of their respective contexts and reflect those; easier when following process model discussions

material and learning activities. Crowley, Chen, and Gisbert Cerver (2018) reason that these approaches are especially efficient in international online programs and their “particularly challenging” preparation (p. 3). In both approaches, time commitment proves to be the most relevant factor why international partners should work with transparent milestones yet flexible timelines while developing a new program.

Finding the right balance between time management, a guiding structure, and considerations of social aspects is equally crucial in curriculum design that addresses the program level as it is for actions on the level of individual courses. For the latter, research offers again valuable perspectives.

### Curriculum Design on the Course Level: Valuable Starting Points

In each course or module, teachers should be aware that different curriculum dimensions overlap and interact constantly, especially in higher education. Such an approach might yield insights that can be valuable for the design of the curriculum of single courses and also as a foundation for the redesign of entire study programs. Leask (2015, p. 8 f.) describes these dimensions and their connections as follows: First, there is the formal curriculum, which refers to all the planned experiences that students will make during their studies. This includes learning activities and assessments, information that is provided, and the teaching approaches one applies. On the course level, the formal curriculum is closely linked to the syllabus. The second dimension is the informal curriculum, which comprises all the additional and – most

of all – unassessed activities of students, in relation to and beyond a single course. These activities can focus on the social aspects of one’s studies, like networking events, and often address current learning needs (e.g., e-tutors supporting academic writing processes). Some of these activities are pre-organized or provided by the institution itself, others emerge thanks to individual initiatives of student groups. Even though unplanned for and sometimes unknown to teachers, the elements of the informal curriculum influence the learning experience of the students immensely. Sometimes they “[. . .] complement what happens in the formal curriculum” (Leask, 2015, p. 8), yet sometimes they may also be “inconsistent and opposed to it” (ibid.). However challenging these – at times conflicting – interactions between the formal and the informal curriculum can be for students, the real challenge lies in understanding the implicit elements within a teaching and learning context.

These belong to the third dimension that one should look out for while analyzing the curriculum. This dimension is called the hidden curriculum. The name implies that these elements of the curriculum include unanticipated expectations or unintended messages that students are confronted with during their studies. These implicit messages can be sent by their teachers, and also by their peers, via learning materials, the setup of a course management system, or through the mode of assessment (cf. Nahardani, Rastgou Salami, Mirmoghtadaie, & Keshavarzi, 2021; Thielsch, 2021). To better understand the complexity of the hidden curriculum, especially in distance education and virtual exchange contexts, Anderson (2001, p. 33; referring to Ahola, 2000) recommends to acknowledge that this dimension of the curriculum includes different subdimensions. Adapted to the context of higher education and international partnerships, this chapter suggests the following summary of these subdimensions:

- Learning to learn in *this* course (e.g., using the tools and collaborating with peers).
- Learning to be a student in *this* formal context (e.g., the role as student might differ in an asynchronous joint classroom compared to an on-campus, synchronous lecture).
- Learning to be an expert in this disciplinary context (e.g., knowing how to act meaningfully in the courses’ disciplinary approach aka being socialized in this discipline).
- Learning “to play the game” (Anderson, 2001, p. 33) in *this* learning environment (e.g., how to address the teacher in emails and other invisible aspects).

In international teaching contexts and in online courses in particular, these subdimensions need to be carefully considered and reflected on by the teachers that are involved. This is of great importance, since “[t]he online environment is infinitely changeable [. . .]” (Nahardani et al., 2021, n. p.) due to its often (culturally) heterogeneous student group and the variety of educational technologies that can be applied to facilitate learning. This variety which allows selecting a suitable tool for a specific setting and/or target group can also cause challenges for those who are involved in a course. Related to this, Pedro, Barbosa, and Santos (2018, p. 10 f.,

referring to Gibson, 1986) argue that the use of a new technology or any other (pedagogical) element changes the “ecosystem” (ibid.) of the educational environment in a way that teachers and students alike must be prepared to integrate it in their educational practices.

This applies to the course level as much as to the level of study programs, their bureaucracy, laws, and regulations. But even though such administrative aspects influence the hidden curriculum (e.g., by using specific learning management systems), it is the teachers’ behavior and their teaching approach that ultimately affect the students’ learning in class (Nahardani et al., 2021). Keeping this in mind, teachers should methodically build the educational environment of their courses and discuss its characteristics with the students. Furthermore, they should reflect on their teaching environment preferences as well as their academic socialization, both of which add to the hidden elements of the curriculum in a course. Even though it can be assumed that there is never only one version of a hidden curriculum in one context, but rather multiple evolving versions (Thielsch, 2017), the students encounter these realities through the way a course is organized and facilitated. Being mindful and explicit in its design, therefore, should have highest priority in international as well as in online settings.

Based on these insights it becomes evident that curriculum design does not only depend on those who develop its frameworks, but on those who design and facilitate the courses as well. Regarding this, Beelen (2017) accurately points out that in fact teachers often are “the missing link” in higher education strategies. However well the strategies, its sustainable implementation depends on those who provide the bridge between the curriculum as framework and the curriculum as possible experiences for the students. As means to support the academic teaching staff, it is necessary to reach the relevant agents in a specific context – those who are involved in international modules – and to connect them with the “key stakeholders” (Beelen, 2017, p. 146) that can support such processes: specialists in internationalization, educational developers, and – in case of virtual exchange contexts – educational technologists. Furthermore, and especially in broader strategic partnerships, this should include possibilities to build relationships between faculty members of the different partners (Bordogna, 2018) and to initiate peer learning situations. Offering each other insights into one’s teaching realities, their contexts, preferred approaches, and technologies, may not only prepare colleagues for their international teaching experiences, but also provide the reflective impulses needed to be explicit in one’s own teaching.

---

## Implications

As has been outlined in this chapter, curriculum design for digital learning offers in international educational contexts, especially in international higher education, is a multilayered and complex process. The resulting learning offers can be extremely rewarding experiences for both learners and teachers involved and have the potential to intensify institutional partnerships, but the process of designing such curricula

may well be demanding. Educational policies – in Europe, for instance, the European Commission’s Digital Education Action Plan (2021–2027) or the Communication on the European Education Area – influence HEIs strategic efforts in this domain. Here, currently more than 280 higher education institutions are part of so-called European Universities (EUNs), i.e., European HEI alliances that are piloted in two rounds of an Erasmus+ call. These aim at transforming the European Higher Education Area, a goal that will involve not only substantial efforts in linking campus (infra)structures but also a collective push to make curricula more flexible in order to allow for the “seamless mobility” – physical, virtual, and blended exchange opportunities – envisioned in the call.

Both VE and VM play a key role in European strategic partnership networks and are often conceptualized as steps toward physical mobility. More longitudinal studies such as Lee, Leibowitz, and Rezek (2021) could generate insights into how virtual opportunities for international and intercultural engagement affect physical mobility and potentially alleviate some of the perceived barriers to study abroad. In a similar vein, blended mobility (a combination of virtual and physical mobility) is to play a significant role in the Erasmus+2021–2027 program, with the first so-called blended intensive programs being funded in 2021. In the coming years, accompanying research might scrutinize success factors for intercultural exchange in blended programs.

Research in (online) distance education show that “[. . .] learning and teaching is seen as the result of careful design and orchestration of the learning environment, communication processes, learner support and use of learning materials” (Zawacki-Richter & Naidu, 2016, p. 249). From a curriculum design perspective, it seems advisable that future research explores the perception of the learning environment in (joint) international online programs in more depth, especially in COIL or VE courses. Analyzing these perceptions might be helpful for future academics who engage in the design of these programs. Even though each new course should be designed in a context-sensitive manner, such insights might exemplify the challenges and possibilities that can emerge in different educational environments for different groups of learners and therefore increase the awareness of what “context-sensitive” can imply in these settings.

When it comes to developing future curricula, the following points should be given special consideration: Along with other issues concerning international partnerships in higher education institutions, Internationalization at Home measures, such as curriculum development initiatives and virtual collaborations, frequently land on the desk of international officers. While international offices with their “helicopter perspective” involve in strategic processes and their good internal networks play an instrumental role (Brunner-Sobanski, Haug, de Louw, & Reiffenrath, 2021), internationalization activities as the ones outlined in this chapter strongly depend on the ownership of the academics, study program coordinators, and students involved. VE and VM in particular continue to pose a number of questions, ranging from legal implications and data protection compliance, technical solutions, and didactic scenarios to issues of intercultural communication. This urges a range of stakeholders across the institution to become involved in processes of internationalization, such as curriculum developers,

instructional designers, and educational technologists. Building bridges inside the institution and enabling networking between these service units is thus key, as is an ongoing exchange of experiences and learnings. Interdisciplinary communities of practice inside the institution can foster such an exchange and reinforce the support structures that may already be available to teachers seeking to design a curriculum together with international partners. Making explicit that such a collaborative approach aimed for, instead of the exception, should be a strategic decision international partner institutions should make, to ensure the quality of their joint programs.

Part of such support structures should be to work with and critically reflect on the various curriculum design models, their benefits, and their limitations. This includes that HEIs should be well aware of their own approaches when (re)designing study programs or international modules and to communicate these approaches openly within their institution (cf. Hudzik, 2015). In addition to such a top-down impulse, emphasize should be put on implementing initiatives that support academic teaching staff to develop (additional) teaching competencies beyond the level of course design and active learning strategies. Such initiatives should focus on helping academics to become a reflective teacher (Ashwin et al., 2015) and to understand the hidden expectations in their own teaching practices (cf. Thielsch, 2021). Research in the field of educational and faculty development stresses that academics can best develop these (additional) teaching competencies to reflect and adapt their understanding of how teaching and learning *should work* in collaboration with their peers (Roxå, Mårtensson, & Alveteg, 2011), a finding that can be easily applied to situations in which teachers are getting used to designing and facilitating online courses well.

Considering the significant role of academic teachers for successfully implemented international modules and courses, the question arises how HEIs can recognize and acknowledge the efforts of this group. So far, structures to award faculty members for their participation on international endeavors and their achievements therein are seldom, if not missing in the educational sector (Eddy, 2010).

---

## Conclusion

In discourses on internationalization (at Home), the notion of “Internationalization for All” has recently gained currency as HEIs strive to adjust or create measures in an effort to better include underrepresented groups in international activities. In 2021, for example, the Academic Cooperation Association (ACA) (2021) “prioritised learning more about and supporting inclusion in international higher education in the context of Europe.” At the same time, it is well worth to critically reflect on the nexus of internationalization and diversity and inclusion and invite the question of how partnerships can serve the purpose of making internationalization activities more inclusive, especially through the role they play in curriculum design processes. A joint and thorough reflection on the influence of the hidden curriculum on the formal curriculum may, for instance, help to uncover traces of colonial thought in the curriculum and help to foster decolonial approaches or the integration of indigenous

perspectives and knowledge(s) into the curriculum. Along the different sub-dimensions developed above, teachers will need to probe the inclusiveness of the tools and learning environments used in VE and other joint teaching settings. It is not only in North-South partnerships, but also in partnerships between Europe and its southern and eastern neighbors that issues of in/equality and the question of how technology may reinforce or remediate these need to be addressed. With regard to VE and its potential for inclusion, O'Dowd and Beelen have recently voiced scepticism and have urged practitioners not to assume that "Internationalisation at Home and VE are inherently inclusive" (O'Dowd & Beelen, 2021, n. p.). While they note that many of the issues that factor into persisting inequalities in virtual collaborations are already known from physical classroom settings, more research into "how processes of inclusion and exclusion play out in virtual settings" (ibid.) is needed.

Barnett and Guzmán-Valenzuela (2021) stress that the "socio-economic-cultural spaces" in which HEIs exist are changing, widening, and becoming more porous. Educational institutions of the twenty-first century, which are maneuvering in these new contexts, should be aware of their social and epistemological responsibilities. Responsibilities involve developing a critical awareness of hegemonic ways of knowledge production and the will to challenge them (ibid.). To significantly engage in international partnerships and collaborate in teaching and learning situations can be understood as one step toward such responsibility. Not only because of the international perspectives involved in curriculum design processes, but mostly because of the diverse perspectives that students in international contexts will encounter.

Educational institutions can support these tendencies by inviting for openness in teaching and learning. Teachers who openly engage in discussions about their teaching practices might be better equipped to engage with differing perspectives in their own (international) courses and to support their students to be equally able to do so. Further research regarding the usage of open educational resources (Mishra, 2017) or open educational practices (Ehlers, 2011) in international partnerships might be a valuable means to foster such a notion of openness. Likewise, studies on how to establish and sustain communities of practice among the members of international partners are needed to emphasize their value in curriculum design processes. Because no matter how well established an international partnership is or how sensible curriculum design processes are being approached, it depends on the teaching competencies and critical openness of teachers to make both meaningful.

## Abstract

In reviewing Indigenous approaches to open, distance, and digital education, the authors found that Indigenous people have been keen to adopt and adapt technologies for their own uses and purposes but are less successful in controlling and creating technologies that dominate the learning landscape. Given the scant literature available on this topic, using the methodologies of kitchen table talks, the authors dialogue their experiences working with Indigenous people and designs in open, distance, and online teaching and education. Through their storytelling, the authors elicit examples of experience in postsecondary education contexts in Canada including the use of talking circles, blended and inclusive learning, development of safe spaces and hubs, and challenges balancing home life and online learning. The importance of relationships, community connection, and validating self and identity in the learning experience were strong themes that emerged from the dialogue. Indigenous pedagogies and knowledges online is a relatively unexplored phenomenon and this initial foray into characteristics,

successes, and challenges may be a starting point for future scholars to follow. By sharing highly contextualized narratives from Canada, we aim to increase the global dialogue around decolonizing ODDE and therefore end the chapter by examining our experience against ongoing international discussions.

**Introduction**

Within Canada, reproduction of colonial systems and values is exhibited at all levels of education, so it is unsurprising to see the impacts of non-Indigenous values permeating online education, both in the development of the tools of learning and the ways in which they are adopted and used. Dron (2021) argues all technology fits into typology consisting of two categories. Hard technologies, he classifies as those which fall into predictable, anticipated patterns of use that cannot be changed by participants, while soft technologies are those whose use can be influenced by the user. The Dron (2021) characterization provides a lens for exploring the permeating values of digital learning tools predominating open, distance, and digital education (ODDE) in Canada, which can be identified as both hard and soft when the cultural values underpinning the design of the technology are evaluated. For example, most formalized education systems have adopted some form of Learning Management System (LMS) as a centralized and secure place for digital education. This tool determines how students and teachers behave and what can be shared and determines patterns of communication, based on the expectations of the designers. This is considered a hard technology and as this chapter will discuss is made considerably more impenetrable when the cultural values of the users are different from the designers of the technology. Many institutions in Canada from K-12 public education to postsecondary have made valiant efforts to soften technologies used, to increase accessibility, and to engage with more open educational resources adopting social media and more flexible tools than the aforementioned LMS. Some of these efforts will also be explored, through a discussion and analysis of the critical points, which make technologies culturally harder or softer to navigate. Numerous articles have been written from multicultural, social justice, and critical pedagogy perspectives outlining that online learning design is not culturally neutral (McLoughlin & Oliver, 2000; Myers, 2021; Öztok, 2019); however, very little has been written about the conflict between Indigenous worldviews and the biases inherent in educational technology. In the absence of a large body of evidence to draw upon, creating a reference work seated in third party research becomes challenging. Furthermore, to minimize the impact of pan-Indigenizing, or reducing the Indigenous experience to themes, we begin, as is common practice with research in Indigenous communities, with the highly contextualized stories and locations. From there, we move outward to international issues and themes, which have arisen from colonial contact globally.

Therefore, this chapter diverges from others in this series as the discussion progresses. It is first important to clarify through use of a generalized characterization of Indigenous world view as it relates to education, where the hardness or conflicts in values arise for Indigenous students and educators. Next, a traditional synthesis of the limited literature available is shared with critical themes impacting systemic and classroom-based ODDE adoption by and for Indigenous students. However, perspectives on the challenges and opportunities differ somewhat, depending on individual positionality. How colonial systems are experienced as an Indigenous person is very different from that of a non-Indigenous person. Therefore, to deepen discussion, the themes are unpacked through a process of storytelling, as the authors, from their alternative positions, share their research, struggles, and efforts in decolonizing, or softening education and technologies, respectively. The chapter closes with an invitation for further research and discussion on the role grass-roots, or microlevel interventions can play in beginning the process of dismantling systemic bias.

## Framing the Landscape

Although each Indigenous people has a distinct expression of worldview developed over long periods of relation with land and community, there are many remarkable similarities across Indigenous peoples that contrast with Western (non-Indigenous) worldviews. Of course, there are individuals and subsections of both Indigenous and Western peoples who counter, resist, or differ from the norms ascribed to their culture, but the generalizations are nonetheless instructive. In creating a list of characteristics of Indigenous approaches to teaching and learning and knowing, for the sake of comparison for an international audience, it is necessary to make some generalizations.

Indigenous epistemology is characterized by Castellano (2000) as holistic, narrative, orally transmitted, experiential, and personal. Storytelling, which embodies these characteristics, is a central tool for teaching and learning in Indigenous contexts (Cajete, 2017). Everyone is a potential teacher, and the Land is the supreme teacher. How each person experiences their relationships with land and community, and contemplates and processes the meanings to be made from these relations, can lead to deep learning. “Ways of knowing and learning in an Indigenous paradigm are . . . profoundly personal and spiritual, based upon a journey into the inner meta-physical and spiritual worlds of the self” (Madjidi & Restoule, 2017, p. 167).

Equally important to Indigenous pedagogy are the various modes of experiential learning, such as modeling, observation, in-context learning, apprenticeships, learning games, and tag-along teaching as methods for “learning by doing” (Simpson, 2000, p. 257). “Through observation, experience, and practice children learned the skills, beliefs, values, and norms of their culture” (Swan, 1998, pp. 51–52). “Indigenous epistemology conceptualises education and learning as both life-wide (happening across formal, nonformal, and informal settings) and lifelong” (Lanigan, 1998, p. 106). Learning, in an Indigenous paradigm, tends to be experiential, personal, and highly contextual.

Arising from the tensions of worldview and the literature review, two complex themes emerged: contextuality of learning design and relationality, authenticity, and Indigenous identity online, both in and outside of education.

## Contextuality in Learning Design

In some of the earliest discussions of contextual needs in website design, Collis and Remmers (1997) characterized websites in two typologies, those with low-level context designed for international or universalized navigation and understanding and those designed to be highly contextualized for very specific local needs. While critiquing instructional design practices specifically, Henderson (1994) identified most design for online learning at that time, fell into one of three approaches with respect to culture: inclusive, inverted, and unidimensional. Inclusive design, according to Henderson (1994), examined perspectives of minority groups but did not challenge dominant culture, while inverted designs began from the minority perspective first, but potentially failed to prepare learners with the cultural capital needed to succeed in mainstream society, and finally unidimensional designs ignored diversity entirely assuming cultural neutrality in learning. Henderson (1994) called for a fourth model, which reflected the multicultural realities of society, included multiple cultural ways of learning and promoted equity of learning outcomes. These two early works have been contrasted to highlight that it is not only the “hard” design choices of online learning structures, but also the “soft” pedagogical and teaching positionalities which need consideration. As early as 1999, Joo (1999) warned that the universal design of the Internet has the potential to impact microlevel student-teacher interactions as well as the macroculture of education and politics by enculturating students into universal expectations. Since that time, there have been repeated calls for systemic attention to culturally inclusive learning environments, through the adoption of local cultural context, values, and language (McLoughlin & Oliver, 2000; Myers, 2021; Öztok, 2019).

In Canada, despite the Truth and Reconciliation Commission’s calls to action (2015) addressing systemic challenges in all areas of Canadian society, with specific calls for education, strategic change to support Indigenous centric digital learning has not yet been addressed. Digital infrastructure, for communities with low populations separated by large distances, has only become a recent concern of national funding initiatives (Kuersten, 2018). Remote learning, for these communities, which are predominantly Indigenous, has been dominated by correspondence models, with very few e-learning opportunities (Barbour, LaBonte, & Nagle, 2020). This appears to be a consistent challenge internationally as Reedy (2019) describing the experience of Indigenous students in Australia has reported parallel issues of unrealistic institutional expectations for technology infrastructure, access, and reliability as a key challenge to participating in online higher education.

In contrast, Internet and social media usage is as ubiquitous in Indigenous communities as it is in mainstream Canada, and while there are differing views

regarding the acceptance and use of the Internet within Indigenous communities, its adoption by communities continues to be fundamental for the development of basic rights such as social security, cultural expression, and conservation (Castleton, 2018). Pfeifer (2019) described Inuit usage of social media as a tool for resistance of colonial oppression and amplification of cultural values. Pfeifer (2019) contrasted his observations of the usage of Facebook, by non-Indigenous users as a space for self-promotion, while Inuit usage was a space for community support and aid. Through this same discussion, he cautioned non-Indigenous researchers to critically examine their analysis of Indigenous social media usage, against their personal, potentially misplaced, and unacknowledged cultural bias. Unlike digital learning tools, Internet and social media have been quickly adopted and become important elements supporting community and contextualized learning (Bujold, Fox, Prosper, Pictou & Martin, 2021). In more examples from the north, social media and mobile devices have been used to ensure community safety through report conditions of the ice for hunters/travellers, disseminating traditional stories, teaching traditional skills, and recording a collective history of communities and experiences (Castleton, 2018; Cook, 2018; Hicks & White, 2000). Indigenous youth are avidly using digital technologies, which they have the ability to mold, to build relationships, and to support their learning, culture, and identity with the wider world (Bujold et al., 2021).

## **Relationships, Authenticity, and Identity**

Bennett, Tanoa, Uinik, and van den Berg (2021) have discussed the need for online learning with Indigenous students founded in a relationship's first approach, concentrating on designing inclusive learning approaches and taking digital inequity into consideration. The development of authentic relationships in online learning is not solely a challenge for Indigenous students. However, Reedy (2019) identified Indigenous students face greater challenges to relationship building in online learning spaces because they had no safe mechanism to self-identify nor connect with other Indigenous students, which contributed to greater feelings of isolation in learning. Within this study, conducted pre-COVID-19, students also identified the feeling of being forced into online learning as the only option to continue study without having to physically relocate, which led to feelings of resentment which were amplified by the lack of Indigenous specific supports provided for distance students. Finally, students identified a conflicting values frame in the relationships they attempted to make with online peers, describing relationships as uncomfortable because they felt they were competitive rather than supportive connections. Arising from these findings, Reedy (2019) developed recommendations for online learning designs for Indigenous students, which included designing for social connection, facilitating interaction between Indigenous students, nourishing interaction via cultural interfacing, ensuring the teacher is present and plays a supportive role, ensuring content is diverse and ensuring materials are accessible through flexible ways of interacting.

As has been observed in multicultural learning environments, Reeves and Reeves (1997) argue that miscommunication and challenges in learning arise when cultural expectations differ, or the teacher shares a form of interaction/learning that is not universally accepted or understood by the students. The language of the learning and tools in Canada is predominantly English or French, while in person learning languages can be as flexible as the speakers in the room, work online is limited to the language of the tool, and the Roman orthography limitations of most interfaces. Beyond cultural misunderstandings, Moodley and Dlamini (2021), sharing examples from South Africa, describe the pragmatic challenges of incorporating less common African Languages in digital tool development in relation to issues of political recognition, translation of technical terms where no Indigenous term preexists, and accessibility of information when translation is not possible.

In short, scant literature could be found presenting rigorous analysis of the role and function of ODDE with Indigenous communities, but rather case examples of practices. Therefore, towards building a systematic analysis, the remainder of this chapter takes a parallel approach, as authors share our research and experiences as highly contextualized examples, as Indigenous researcher and ally in relation to describing decolonized approaches to online learning.

Kitchen table talks, a method identified by Tootoo (2018), was adopted as a methodology to describe and analyze issues of Indigenous ODDE while making the authors' positions apparent. This approach is founded in informal conversation and can also be considered a form of storytelling. Storytelling is an accepted means of knowledge gathering in Indigenous contexts, and as Smith (1999) discusses, a means to privilege Indigenous ways of knowing by shifting the balance of power from Western communication patterns to Indigenous. Our table talk sessions took place both asynchronously and through phone conversations as we worked together on opposite sides of the country currently called Canada.

## The Conversation

JPR: My first foray into designing an online course was a MOOC (Restoule, 2013), the first MOOC ever taught at Ontario Institute for the Studies of Education (OISE) at the University of Toronto. The Dean felt it fitting that the first MOOC should be about Indigenous education and invited me to design it. My main concern when teaching face to face was fostering community in the classroom, building relationships with the students and ensuring they all could bring forward their gifts in our meetings as we discussed the readings and held circle. Translating this experience online, and to a MOOC no less, was going to be a challenge. An activity we held in face-to-face classrooms was to draw a place that holds special meaning that we then linked to one another and/or displayed on the wall while discussing the themes that emerged. Our technology translator helped convert the activity to online space where we could upload pictures or files about our special place before the thematic reflections.

One of the early hard (Dron, 2021) technological limitations of the MOOC platform I discovered was that video lectures anchored everything. If you wanted people to upload their special place and then discuss it, they could not simply do that activity. There had to be a lecture video that led them there. We created videos to explain the activity. I have to admit that this could be a useful tool to have the instructor discuss the activity in a friendly way but I abandoned scripts early on as they felt too rigid, unnatural. When I used a teleprompter I felt robotic (even if I wrote the words!!). I preferred to have a sketch of what to cover and then talk as it felt more direct, natural and like the classroom experience. But when it comes to activities and graded portions, precision and accuracy in expectations is significant, and videos, while useful, could sometimes seem to present a different nuance or weighting on parts of the assignment. The more content added and in different formats, the more potential for multiple meanings and for misunderstanding. As much as MOOC course design has this idea that you can wind it up and let it run on its own, I see this as one of the central tensions in designing online learning with First Nations approaches to learning in mind. Whereas First Nations learning is highly contextual, located in a specific community or context, where the teacher and the learner know each other and have a relationship, with online learning the teaching is transactional and generally designed to apply to a wider audience, assuming in the process there is a universal learner (Restoule, 2017). In the same way Western science knowledge assumes universality, much online learning assumes universality in the knowers and learners, rather than situating the learning in the relationship between them, not unlike Henderson's notion of inclusive design.

KMS: While JPs first experience designing online learning in higher education focused on relationality and context overcoming the limitations of the tools, my first experience was a partnership design with the Indigenous services department supporting pre-nursing students' transitions which sought to apply university adopted tools to a better purpose (Snow, 2016a). In this example, building on the literature of accessibility, which pointed to the need for flexible learning, community and authenticity (Shield, 2004). I worked with a nursing instructor to design online supports, such as recorded lectures, pre-lesson scaffolds (in the form of power point lecture notes), and an asynchronous discussion space. Over the course of 1 year, I interviewed students multiple times to determine what if any of the online scaffolding was useful. I learned, very little was. Looking back, it makes sense, we had applied our colonial deficit thinking to the "problem" at hand. The problem was content acquisition in a content, terminology dense subject, fundamentals of clinical biology for nursing. We didn't acknowledge the students position. While the pre-distribution of course materials offered flexibility, students found the discussion space onerous; if they had questions, they emailed the faculty member directly, or a friend. They didn't have time to read all the posts to discuss, they needed answers quickly. The recorded lectures were still lectures; they were useful if a student missed a class, they were useful for revision because students could fast forward and rewind, to review, but it was still a lecture, which shared compartmentalized, decontextualized biological concepts. The prepared notes faced similar challenges,

designed to teach content, not students, but identified these as the most beneficial support because they enabled students to pre-read and freed them from the arduous task of taking detailed notes during lectures, but rather annotate the lecture notes with their understandings. The primary criticism of the supports was lack of context. Students told me, “I can’t see the forest for the trees.” In one of the most poignant conversations I had, a participant told me they entered the program to be a nurse but feared the disconnected knowledge shared in biology class could potentially cause harm to future patients. The connection between course content and nursing practice was not transparent and this lack of understanding was perceived as scary.

My second attempt at supporting Indigenous students in higher education came at the request of the program Manager for a First Nations community based Bachelor of Education program. My supervisor, again seated the challenge of the course in flexibility and accessibility offered by online learning design (Snow, 2016b). The concept was to offer a blended learning course during winter term to reduce driving for the students, most of whom lived more than 60 min of prairie highway driving away. The first critical lesson about the systemic barriers exacerbated by online learning controlled by the institution, for band and employer funded students, arose immediately. As the fee paying organizations worked on independent timelines from the university, many students were placed on “academic holds” and barred from online learning while the university waited for bills to be paid. Academic holds posed no problem in face-to-face courses where students could enter at the instructors’ discretion, and the working practice was to keep a department-created instructor register separate from the official register, until all the fees were paid. However, as we moved online, it became quickly apparent to me as instructor who had paid and who had not, because students with late fees were blocked from online systems in an automated and cascading process that no doubt was efficient for university systems, but from my perspective was an invasion of privacy. As instructor I did not want to know, who has paid and who has not. I just want to teach. Students were forced into the position of explaining, and asking me to develop workarounds for their courses, which I did readily, pulling material out of the university mandated tools, such as the LMS, and placing them in open access locations, such as google docs, where everyone could access. This forced me, in an effort to support all students, to abandon university provided technologies and to act as an advocate with the finance office, to allow the students into courses.

JPR: Observation, experiential learning and relationship are important aspects of Indigenous pedagogy (Simpson, 2000). I remember as an undergraduate that if I really liked a lecturer or a topic that I could sit in the room and learn from the lesson whether I had registered or not. I sat in on a number of lectures on Ancient Egypt that were fascinating but never appeared on my transcript as I was not formally registered. That is simply not possible with courses taught online at a university or college. Maybe that is part of the point with LMS—further institutional control. If you don’t pay you can’t play (learn) and it furthers neoliberalism of post-secondary education as a business rather than a public service. At first I thought this was a side comment but perhaps really it’s the point!

KMS: Beyond the limitations of flexibility and hierarchical institutional control of adopted technologies in post-secondary, there was a second fundamental learning I realized within this blended learning course (Snow, 2016b). Taking away scheduled in person class time, doesn't necessarily increase flexible learning time for students. Many of my students continued to make the 60 min drive to the city to meet with their cohort at coffee shops or in our abandoned classroom, because this was time negotiated away from home that families could understand. It was much harder to ask family to respect independent study time at home, and for many the space at home was not conducive to learning.

JPR: Relationality, and family and community responsibilities often take priority over learning and technology can support students. There was an occasion when a student taking her degree from Sudbury was attempting to select only online courses in order to get her M.Ed. She really wanted an Indigenous focused course but all the OISE offerings were in person. She asked whether she could come to some classes in person, monthly, yet be videoconferencing with the group other days. I decided to give it a try and it was very DIY. . . I literally called her on my laptop (using Skype) and put the computer on a table or chair within our circle. She could see everyone with the exception of the people seated on either side of her (the laptop). When we had group work, she would be assigned a group and her group members carried her to wherever they were meeting. We ensured she knew who was talking by introducing ourselves when we spoke and indicated when we were finished.

This student told me she always felt like part of the class and was not missing anything. The students in person told me they didn't feel put out by having her there on screen (I've participated in some courses where it is a little disconcerting. . .for instance when someone is on a large screen and their image is larger than life, or the volume settings make their voice boom over everyone's). This participation was relatively seamless.

I allowed some future students to do the same when a situation warranted it, including one student who had to be in Africa for a month during the course. So I suppose I had flirted with ways of doing Indigenous pedagogy (like circle) with modifications to allow distance learning and technological inputs for some years before the MOOC. My goal was inclusion and accessibility. How can we facilitate participation and learning for someone who is not always able to be there physically? And If we could adapt our processes to allow someone coming in via computer, what if everyone was on a computer? That was part of the thinking with the MOOC and something we'd adapt differently when doing our smaller private online course for principals (Tessaro et al., 2018).

KMS: Building on my first attempt at blended learning with Indigenous students, my second attempt was better positioned in Indigenous pedagogy to support trans-cultural learning through relationship and consensus building (Snow, 2020). As I started my first job, as an assistant prof in a faculty of education, I was faced with teaching two cohorts of students concurrently, the mainstream, predominantly non-Indigenous Cape Breton Island campus students and a second cohort in community on mainland Nova Scotia. Separated by about 350 km, a daily or even weekly commute was not possible during the winter months. However, we adopted

a blended learning approach that saw lessons delivered face-to-face once a month, within the separate cohorts, while the majority of the work was completed online or in working and learning contexts where the students were located. From simple open ended tasks that allowed students to illustrate their perspectives and creativity through product creation (for example videos of lessons, lesson plan design, experiment development) L'Nu students were able to invite us into wider perspectives on education, learning and community life. The sharing of perspectives and spaces across the two cohorts allowed students a glimpse into one another's world that was discussed at length in the individual cohort face-to-face sessions. The challenge of this course, was building trust across the cohorts, though they were very open among themselves, discussion between the two groups in the online space was often reduced to affirmations "love your work!" or questions "how did you. . ., can you tell me more about. . .," if they acknowledged one another at all.

JPR: I'm struck by the description of how simple videos and sharing of spaces opened up possibilities for transcultural learning. When a team at OISE working with the Martin Family Initiative created a 200 hour online post-secondary course for principals working in First Nations schools, one of the design choices we made early on was reducing the amount of writing and journaling (Tessaro et al., 2018). A first pass through our draft 10 modules made us realize that we'd put a lot of additional writing assignments on principals who are already quite stretched. We decided to reduce writing requirements and demand on their time by using simple video uploading and sharing. The videos allowed participants to easily record their speech and upload for sharing. Additionally, they could show what they were talking about by recording their community and school contexts. While the full potential of this capability was largely untapped in practice, what emerged for me was the value placed on relationship building and being able to see one another. At the midpoint of the course, participants met synchronously to discuss the capstone project. Enjoying the synchronous meeting so much, the pilot course participants advocated to change the course so we would meet synchronously for each of the remaining modules (once monthly). This feature became standard in all subsequent offerings and demonstrated to the course design team the importance of relationship for learning in First Nations contexts (see Tessaro et al., 2018). Relationship was one of the foundational "Rs" we attempted to incorporate into each module of the course. The other R's were respect, relevance, responsibility, and reciprocity (Kirkness & Barnhardt, 2001).

KMS: Writing online in formalized tools, the discussion forum of an LMS for example can be problematic. The community based cohort, did something different. They took ownership of discussions and created a safe space for themselves using a Facebook group. They invited me in, for the duration of the course, but let me know, not all instructors are allowed in, so I was only permitted in because they felt I could contribute respectfully to their community without overwhelming the space. In other words, the rules for me were outlined as they welcomed me in, I wasn't to get too "teachery" in there. I participated there for the semester, observing student conversations about the courses, answering questions when I could, but mostly keeping quiet, unless directly asked. It helped me to understand some of the challenges students were facing both with the courses and balancing work, life and school. This

is where the real conversations about the course happened, not in the artificial spaces created in discussion forum. They let me stay, after the course ended, for a while, but as the program ended I was removed from the group (Snow, 2015).

JPR: I remember when the MOOC was active in its first offering in spring of 2013, I was getting off the elevator when I saw a poster for people taking the MOOC. It read, “Meet up Tuesdays in the seminar room.” This was just down the hall from my office! Yet I knew nothing about it. The MOOC was designed to release new content weekly on Mondays. Apparently, this group was getting together after new content came out so they could discuss and work together on the assignments. Amazing! This group was gathering literally 30 steps from my office. But others were forming Facebook groups in cities across Ontario from London, Windsor, Sudbury, Kingston, Thunder Bay, and in Regina, Vancouver, Halifax. These were just the ones I became aware of (I’m not on Facebook, or other socials. . .word just got back to me). Jan Hare, designer and instructor of a UBC MOOC called “Reconciliation through Indigenous Education,” discussed with me the way hubs of learning formed around her MOOC. It’s something we noticed happened formally and informally as people gathered to create a space to meet in person about things they were learning online. In Toronto I was asked to meet a group of librarians who wanted to create MOOC hubs where people taking MOOCs could gather on a regular basis with peer learners to go through experiences together instead of being isolated sole learners at home.

KMS: Recognizing the limiting linear, hierarchical and instructor focused pattern of LMS construction, I tried again, to decolonize this space. In a class designed to examine global and Indigenous perspectives on online learning, rather than a discussion forum, I adopted a cobbled together asynchronous virtual “talking circle” using the LMS blogging tool and a wiki front page, to act as the circle. Students used an electronic talking stick to indicate who was the speaker, with their names (links to their personal blogs) arranged in a circle on the Wiki page. They were required to check back periodically, read the blogs of the people before them in the circle, and when it was their turn, move the talking stick to their name and respond to the issue being discussed by directly building on the thoughts shared by the people before them. From my perspective as the instructor, the conversations were better, but the students, in this case, predominantly non-Indigenous, complained the process was “too much work” and “too difficult to follow.” Danyluk and Hanson (2021), have written about Hanson’s techniques for bringing in talking circles to synchronous discussions. Their work focuses on the importance of recognizing the talking circle protocols, and respecting them in the face of tensions around cultural appropriation. I struggle with this too, as a non-Indigenous scholar, to what degree is it respectful to adopt Indigenous pedagogy full stop, but more so in an online space where misunderstandings are more likely to manifest both for me and my students.

This past 2 years has seen an incredible shift in my work, and not necessarily for the positive, brought about by COVID travel restrictions. The Certificate in Educational Leadership in Nunavut is designed as a co-taught face-to-face program where an Inuk practitioner and frequently a university based academic like myself work together to teach about and for Inuit centric leadership transformation. As this

program moved online, we saw declining Inuit participation, challenges bridging between supported technology in schools and university, as well as infrastructure limitations. The content has always been highly contextual, but much of the learning was through dialogue and reflective practice. To accommodate technology limitations of the arctic and teachers' busy schedules we resorted to almost a correspondence model, with readings shipped in a paper based course pack, teleconference calls, in addition to virtual sessions. As we determined what technology could support, we increased synchronous sessions because reading and writing asynchronously was not sustainable for the teachers. Time to type responses, particularly if English was not first language, the LMS inability to support Inuktitut, time to read and time to process responses into writing was much more difficult than a live conversation. The live sessions, though we assumed would be the greatest challenge as we spanned 4 time zones in Canada, were the most appreciated by the students because that was time people could lock in and concentrate. Ultimately, we had to adopt a highly flexible approach to course completion, with timelines outside of the traditional course calendar and individualized.

JPR: During the pandemic, I noticed the challenges learners had with screentime taking up so much of their daily lives. Parents of young children were distracted having to take time to see to their children's wellbeing and own screentime expectations imposed by schooling online.

In 2020, one student dropped the UVIC Indigenous Education summer institute because he could not find time to plan care for two kids under 5 while taking an intensive when we shifted mode of delivery with only 8 weeks to spare. The summer institute in Indigenous Education at UVIC consists of 4 courses taken over 4 weeks in June. It means 6 h of class daily. (He enrolled the following year, once he had time to plan child care, and had a successful experience). One of the adaptations we made to our summer institute going online was reducing each class meeting from 3 h to 1.5 h synchronous. We made up the additional 90 min with activities, additional videos to be consumed at their own pace/time and other readings. But the focus was on activities that learners could do outdoors, on the land, with family. The idea being you need to get out and away from screens and if you're a parent, you need to balance student life with family responsibilities, so why not make an activity you can do together? We had such assignments as finding sit spots and reporting back on observations. What is a space like at different times? Or find a local plant and learn its Indigenous uses, medicinal, food, other. Share in a video upload. These activities could be done with young people. One of the courses is an arts-based course where the students made a drum and incorporated Coast Salish designs on it—another activity that can be done with children.

## **Concluding Thoughts**

As we reach the end of our chapter, we realize there are more questions raised and starting points identified than conclusions. We began by noting that Indigenous infrastructures and approaches are largely ignored in writing about open learning

and digital education. Indigenous people as always have adopted and adapted technology for their own uses and purposes (Pfeifer, 2019; Valentine, 1996), but are less successful in creating the technologies that dominate the learning landscape. In this way, there is continued cultural imperialism embedded in the dominance of the most prominent learning platforms, software, and management systems. They are culturally “hard.” Though we began with the specific example of Canada, this same colonial domination permeates LMS design internationally (Dreamson, Thomas, Lee Hong, & Kim, 2017). In the case of online learning delivered in postsecondary education contexts for Indigenous learners or about Indigenous topics, English dominates, and so do assumptions about the delivery of knowledge. In the authors’ experiences, platforms are designed largely to instill or reinforce hierarchies of knowledge while delivering content over geographic spaces and across time (asynchronous) as though they could be removed from contexts and the places and times people are located in. This is a frequent rationale for the adoption of ODDE in higher education internationally, simply a tool for access (Prayaga, Rennie, Pechenkina, & Hunter, 2017). But it fails to address fundamental assumptions underpinning ODDE design. When Indigenous learners or design teams are involved, relationships matter and influence the way learning takes place.

While relationship-building in learning is not exclusively an Indigenous domain, literature indicates it is a must for Indigenous students (Cueva et al., 2018). We saw this in the tension between content removed from relationship and tools that make communication between learners less immediate. Similarly, relationship was critical in large courses, whether fostered in activities linking learners to each other or with personalizing knowledge exchanged horizontally. Content that assumes a universal learner also requires a disembodied transactional approach, one that goes against the ways Indigenous learning has traditionally been done and methods that Indigenous learners prefer.

We witnessed technology in postsecondary education becoming a barrier to learning with students locked out if their tuition was unpaid. Rather than maintaining privacy in their account status, students have the potential shame of explaining their financial status to their professor. We talked about blended learning and how inclusion can be facilitated using adapted Indigenous pedagogies like circle and ways to adapt circle to online spaces. We talked about ways that Indigenous students use technology to connect and create safe spaces for themselves beyond the course, with social media platforms. We discussed additional learning hubs created by learners that create community in contrast to online learning that can feel isolating.

Future research could examine the technological and cultural determinism introduced by learning hardware and software and implications for Indigenous knowledge in online education. Adaptations and changes that bring Indigenous pedagogies and knowledges online can be further examined for their characteristics, successes, and challenges. And the ways learners adapt and interact in online learning spaces for their own benefits, particularly those from and in Indigenous communities would be welcome additions to the larger conversation on open, distance, and digital education.

## Abstract

Understanding how equity manifests in open, distance, and digital education (ODDE) requires us to grapple with several coexisting trends, including the changing forms of teaching and learning provision, the advent of a post-digital society and education, the datafication of education, inequality in society at large, and digital inequities. Most of these trends are social in nature, yet they shape, and are shaped by, the educational sector. It is at the intersection of these coexisting trends that equity issues in ODDE are raised and become apparent, reinforced by the uneven distribution of technology in society, and with deep roots in economic

**Introduction**

Open, distance, and digital education (ODDE) has long focused on removing barriers to access learning, providing flexibility in learning provision, being student-centered, supporting students, and designing learning programs with the expectation that students can succeed (Letseka & Pitsoe, 2012). With the advent of networked digital technologies, open and distance education has become more closely connected to the notion of “networked learning,” which emerged in the 1990s to describe the growing influx of technologies in the context of higher education (Jones, 2015). Dependent on connectivity, networked digital technologies enable connections, community, and many-to-many relationships. Networked learning reflects principles of critical theory (Freire, 1972) as it emphasizes active social roles and individual agency of learners and teachers (Hodgson, McConnell, & Dirckinck-Holmfeld, 2012; Jandric & Boras, 2015; Jones, 2015). Over the years, networked learning has evolved, partly due to the changing nature of digital technologies, and the types of artefacts and tools involved in learning activities (Goodyear & Carvalho, 2014). More recent approaches to networked learning promote a holistic view of learning, foregrounding ‘openness and flux’, and acknowledge blurred boundaries between digital and physical, formal and informal (Fawns, 2019; Goodyear, 2014; Jones, 2015); contemporary studies explore networks beyond higher education contexts, such as those involving work-based scenarios, professional development, informal settings, schools and others (Hodgson, de Laat, McConnell, & Ryberg, 2014).

Despite the decades-long notion of networked learning and ongoing discussions by distance education scholarship about the blended future of education (especially in developed countries), in 2020 many reported that the pandemic brought about a major shift in education. After the “online pivot,” a global view of a postdigital future emerged, shared by developed and developing countries alike, despite the latter’s relatively limited access to technology (Estefogo, Fuga, & Vendramine-Zanella, 2021; Taimni, 2021; Jayakumar, 2021). Arguably, all future forms of education will have a blended or hybrid element; curriculum provision and course design will necessarily integrate digital technologies to a greater or lesser extent. How much, when and other finer details will be determined by context, discipline, and strategy. For example, only specific programs might be able to fully accommodate time and distant separation, while others might require space for co-action and

hands-on activity. These may act as determining factors in course offerings, designs and uses. Nevertheless, there are some courses and programs that will likely (continue to) be offered as online distance education. Indeed, over the years, the online distance mode has been filling the needs of many groups of students, for example, for people living in rural areas (where they have sufficient connectivity), those studying while working or those with family commitments. The online distance mode provides opportunities of access to education to those who may find it hard to comply with physical attendance demands at a certain time and location.

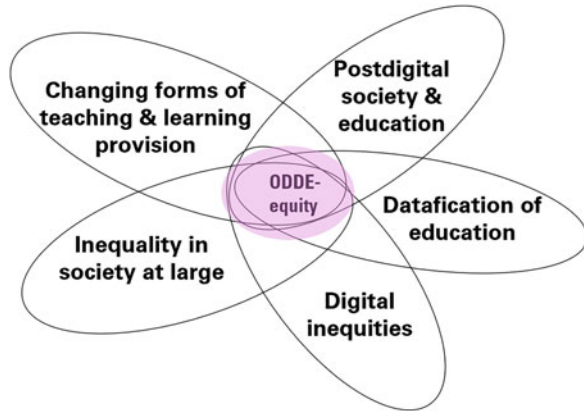

Having access to education can significantly benefit both individuals and societies. Those who are well-educated have higher incomes and better health and report higher levels of well-being (OECD, 2007), but not everyone has the same opportunities to succeed or to meaningfully participate and learn. There are many complex wider issues to consider, beyond time, space or economic consideration, with multiple elements influencing the provision of equitable access to education. Educational institutions (such as schools and universities) have been historically designed to fulfil the needs of a small elite (e.g., male, white, and people of economic means), with structures, values, and practices set up to support some students while excluding and marginalizing others. Equitable societies call for more inclusive education systems, for learning environments that are designed to meet the needs of a more diverse student population, and for addressing barriers that may exclude and marginalize students from education (UNESCO, 2017). Personal and social circumstances should not prevent anyone from achieving their full potential, and so the notion of inclusive education is often used to highlight the importance of dismantling exclusion generated by inequality in society at large, particularly those related to disability, ethnicity, religion, gender, and poverty (Slee, 2011). But there are also other elements at play, such as emerging trends in education, which are changing teaching and learning practices, and the ways digital technologies are transforming living and learning in the modern world.

Equity issues in ODDE are complex and require that we locate the topic at the intersection of several overlapping dimensions. In this chapter, the analytical differentiation of these dimensions is foregrounded in Fig. 1. The figure highlights their relevance to equity on ODDE, while also expressing that these dimensions and ODDE are all largely entangled.

In relation to each dimension and its overlaps, a number of questions must be asked: which interests are served, who is advantaged, who is disadvantaged? How can educators best support students' equitable participation in networks? How can educators encourage all students to connect to others and to learning resources? How can educators and students fairly and productively contribute to knowledge building? And how can they both learn about, and embrace, wider opportunities for living and learning in postdigital societies?

**Equitable participation in education means that ODDE is designed to address the challenges of co-existing issues in postdigital society which is itself inequitable, where education is being differentially datafied and digitized, and where new forms of provision are emerging.**

**Fig. 1** ODDE equity at the center of intersecting trends

In this chapter, several terms are used including equity, equality, inclusion and justice; each derived from the literature drawn on. These terms are linked and all connote fairness but are distinguishable: equality connotes sameness or equal distribution with likely different outcomes; equity connotes appropriate or proportionate fairness; and justice is often defined as participatory parity (Fraser, 2005).

## Postdigital Society and Education

There is a growing view that society can be characterized as postdigital. This does not mean that everyone has access to technology nor that people can fully participate. It rather means that technologies are so implicated in all aspects of life, that even the most disconnected are affected by the imbrication of digital practices into all aspects of society and the economy. The lines between what is considered analogue and digital are blurred (Sambuli, 2021a). Through a postdigital perspective, nothing is strictly digital nor non-digital, since anything digital is always tangled up in social and material activity (Fawns, 2019). Inversely, a non-digital life is near impossible to live, as human routines and practices involve mediation through technologies, even when people are unaware of the digital foundations and structures of life.

In this sense education can be seen as a subset of broader social practices, with the tendrils of the digital extending in different ways to different levels of the system. For universities, there is an additional layer because as knowledge producers, their roles include shaping society and influencing broader social, economic and cultural possibilities. For schools, there are tensions related to how to best prepare young generations for the future. Students need to learn skills and knowledge that will help them best address some of the complex problems facing the world, while at the same time, learn to cope with rapid technology development and to be safe amid new ways of processing and creating new knowledge (UNESCO, 2021).

A dominant framing of postdigital society has been characterized as the Fourth Industrial Revolution (4IR) represented through “a fusion of technologies that is blurring the lines between the physical, digital and biological spheres” (Schwab, 2016, p. 1). 4IR has been widely taken up by educationalists as an argument for reorganizing curriculum ranging from teaching coding in primary schools to recognizing the impact of Artificial Intelligence (AI) in education through AI literacies (Miao, Holmes, Huang, & Zhang, 2021).

While there is no disagreement about the digitalization of society (the foundation of the Third Industrial Revolution), 4IR has been criticized by reputable scholars as inequitable. Firstly, its history and very foundation is inequitable, “the first three industrial revolutions have not created a just and humane world, so why do we believe that the 4IR will do any better?” (Badat, 2020, para. 19); secondly it is predicted it will continue to contribute to ongoing inequalities “[u]nless something dramatically different is done, one of the continuities will be the perpetuation of inequality” (Gillwald, 2019, para. 11), and thirdly that 4IR will worsen inequality – “it is apparent then that a very real possibility is that advances in the 4IR could lead to an increase in . . . poverty, deepening inequalities” (Bajjnath, 2021, p. 10).

To achieve equity in ODDE it is necessary to consider how to enable and support people’s ability to successfully navigate and participate in a postdigital world. This dimension is also closely connected to, and impacted by, inequalities in society at large.

---

## Inequality in Society at Large

Inequality has long been acknowledged as a major global problem clearly articulated in Sustainable Development Goal 10 (UN, 2015), which also acknowledges the extent to which the pandemic has deepened inequality both within and across countries. Inequality is relational and contextual rather than absolute; what counts as being disadvantaged will depend on what counts in a particular location. Inequalities are compound and intersectional (Helsper, 2021). This is relevant to technology because what determines access and participation is therefore fluid and changeable according to specific circumstances and needs.

Understanding the impact of broader social inequalities in ODDE is important, because historical, spatial and social positioning shape (although not determine) individual possibilities, including access to education and opportunities for digital capabilities. People without access to a range of capitals (economic, social, cultural, symbolic) are disadvantaged in ways which play out in different aspects of life including education. Inequalities also limit the opportunities that are available to people, enlarging and deepening the equity gap.

Social inequities have a profound impact on life opportunities and everyday living, therefore addressing digital inequalities in isolation can only be effective up to a certain point. This is a necessary reminder that education is a subset of broader society rather than separate from it. The pandemic exposed the extent of inequities in student bodies by removing a physical campus which could ameliorate differences through the provision of infrastructure such as residences and connectivity.

This dimension allows us to ‘zoom out’ to take a broader stance on equity in ODDE, much beyond the role of digital technologies in education, to look at wider issues that also influence people’s ability to participate in a postdigital world. This dimension calls for a more nuanced view of how inequities are deeply ingrained in the social fabric, and how education is connected to, and impacted by, inequalities in society at large. Conversely, it is also important to ‘zoom in’ and to look closely at some of the ways digitization is impacting education practices.

---

## **Datafication of Education**

Although measurements, audit and data have always been part of education, the embedding of networked digital technologies means the deepening of the datafication of education as all institutional, academic, staff, and student data becomes available as digital data. This has invoked serious concerns regarding the inequities of algorithmic bias, predictive policing and data harms (Marachi & Quill, 2020); the potential of AI being used for surveillance or for measuring the performance of teachers for punitive purposes (Selwyn & Gasevic, 2020); as well as the risks of datafied early-warning systems profiling students on the basis of indicators that foreground student deficits (Dhunpath & Subbaye, 2018).

In addition, digital innovations in education may cultivate hegemonic world views, thereby risking perpetuating colonialist ways of being (Sambuli, 2021b; Williamson et al., 2020; Kwet, 2019). This is achieved in several ways including through subtly delineating who makes up an ideal student or what the ideal teacher looks like. Indeed, there are no “roaming autodidacts” self-motivated, able learners simultaneously embedded in technocratic futures and disembedded from place, culture, history, and markets (McMillam Cottom, 2016); instead there are embodied humans in real lives with inequitable life chances.

Data is often understood to mean digital content, which is generally protected by privacy legislation such as South Africa’s Protection of Personal Information Act (POPIA) and the European General Data Protection Regulation (GDPR). Receiving less attention is metadata, or “digital exhaust” (as per Zuboff, 2019) because it is less visible, less protected, and more opaque. Thus students’ and academics’ location, downloads, uploads, comments, clicks, likes, lingers, connections, logins, logouts etc. have financial value, further amplified when part of a tech company’s broader ecosystem (think Google and all its products, for example). This data can then be mined and aggregated, and sold back to universities.

Questions about digital data pertain to how it is used, owned, shared, understood and made in/visible. The pandemic saw a massive growth in private companies becoming stakeholders in education; for many their business models are forms of platform or surveillance capitalism. Thus education has fed “a new elite, one based on computational power: ...as the division of learning in society shades toward the pathological, captured by a narrow priesthood of privately employed computational specialists, their privately owned machines, and the economic interests for whose sake they learn” (Zuboff, 2019, p. 190).

The confluence of these models of education, capitalism and the pandemic have brought new inequities into ODDE. Internationally, it is well-off countries which can afford to resist the power of big tech companies (see, for example, Pineau, 2021). In many nations, however, already stratified education systems become further unequal as those institutions with financial and cultural capital have more options regarding platforms, tools, and terms of engagement. These institutions are more likely to have the finances and expertise to own, build, and/or take charge of their own data and learning analytics systems. It is thus likely to be more disadvantaged institutions which have no choice but to use so-called free systems which exploit their data (see Avila, 2020 for how this can be a form of digital colonialism). Within these disadvantaged institutions, students may be categorized as “effective” or “deviant” (Selwyn, 2014, p. 52) by the pattern detection of data infrastructures, which brings about an additional form of discrimination. Finally, there is a danger in the capturing of data and how meaning can be derived from it for learning analytics because student data may not necessarily be representative of the potential of students but rather serve as an indication of the intergenerational legacy of economic and political exclusion (Prinsloo, 2018, p. 28).

Datafication in education can affect equity in ODDE, because of the vast amount of data that is constantly generated and the risk of education practices being influenced by algorithmic bias, predictive policing and data harms. It can also enable surveillance when used for measuring the performance of teachers or students for punitive or selective purposes. Datafication of education is also manifested through, and impacts on, new forms of teaching and learning.

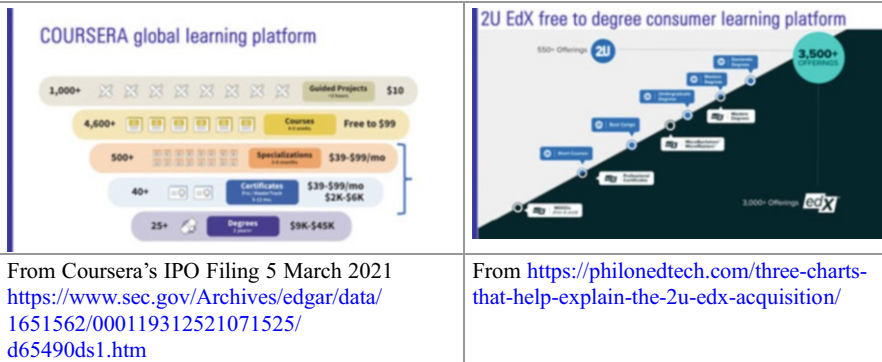

---

## Changing Forms of Teaching and Learning Provision

Types and modes of teaching and learning provision are both changing. Reasons for this include pressures and opportunities for flexibility, the need for cheaper studying options, reduced government funding, the digitization of society, massification with associated diverse student populations. These emergent forms of provision are explicitly linked to the 4IR, as in “With the demands and challenges of the 4IR, a move towards new flexible, often multidisciplinary curricula that move away from the traditional focus on predefined categories and types of learning is required” (Marwala, 2020, para. 13).

### Unbundling

Unbundled forms of provision are generally supplied by private companies, using course curriculum content provided by (largely) public universities, with their self-described “stackable,” models of learning. Some companies offer specific services to educational institutions across the entire student experience (Czerniewicz & Walji, 2019) while others such as Coursera and EdX, provide a single platform to support inter-connected forms of services and credentials.

Such unbundled forms of provision are critiqued for forming more uneven spaces of higher education as well as facilitating new modes of selectivity that favor privatization and commodification (Robertson & Komljenovic, 2015). In short, they risk creating a dual education system, one for the haves and one for the have-nots.

Interested in whether stackable credentials reinforce stratification, one study found that there were noticeable racial disparities in the credentials students earned through stackable credentials implemented by a consortium of community colleges in the United States (Giani & Fox, 2017). As Helsper (2021) points out, such unbundled forms of provision have the potential to exacerbate class divisions as they focus on vocational and practical forms of education, leaving elites to benefit from classic (and with higher status) liberal arts education.

### Any Time, Any Space?

Prior to the pandemic, education institutions had started to actively engage with strategies that incorporated digital elements in education (Becker et al., 2017). In most developed countries, there was also a trend to alter the built environment of schools and universities in order to accommodate pedagogical innovations in teaching and learning (Benade, 2019), and thus align the contours of physical spaces to pedagogical practices that encouraged collaboration, creative thinking, and students becoming critical users of technologies. As such, many traditional classrooms were being transformed into flexible learning environments, which often involved open spaces and breakout rooms, with flexible furnishings, and infrastructure to accommodate different types of technologies. But the use of digital technologies has not been restricted to education buildings. Instead, there has also been an emphasis on new pedagogical practices with opportunities to extend learning experiences across and beyond the boundaries of the physical spaces of schools and universities. Such a trend is in line with ecological perspectives in learning, which foreground learning activity within multiple contexts, social practices and tools (Damşa, Nerland, & Andreadakis, 2019; Vartiainen, Nissinen, Pöllänen, & Vanninen, 2018). In the past decade, the materiality of elements (e.g., materials in schools, universities, home, or elsewhere) started to be perceived as contributing to ways educators and learners

interact (Woolner, 2010). Materials and their properties subtly influence learning activity, for example, through ways of arranging flexible furniture, and how the layout of open-plan classrooms and the technologies may support learning processes. All of these bring about different possibilities for how spaces can be (re) configured to accommodate different forms of curricula and social arrangements (Carvalho & Yeoman, 2018). Yet, as Thibaut (2020) remarks, internalized cultural models about how pedagogical practices ought to unfold in classrooms seem at times crystallized, encouraging the reproduction of old teaching models with new tools, and overall impacting on the creative adoption of new technologies and innovative pedagogical practices.

Recent debates surrounding flexible learning spaces also recognize that physical classroom environments may influence inclusion, as much as they may also contribute to actively excluding some students (Benade, 2019). Flexible learning spaces demand careful design, through deep considerations about the configuration of materials and spaces, pedagogical strategies, and social organization of learners that may best support the full participation and engagement of all students (Carvalho, Nicholson, Yeoman, & Thibaut, 2020). These debates have also been accompanied by new directions in policy discourse, which are shifting from issues connected to equality of access to equity of outcomes – where the focus is on preparing students for the knowledge economy. However, as Benade (2019) points out, such a shift to promotion of outcomes can also be seen as part of neoliberal agendas concerned with comparative performances under international rankings, which in turn, are more likely to symbolize a neoliberal individualistic and competitive spirit rather than express a disquiet about socially just inclusion (Kearney & Bevan-Brown, 2014).

During the pandemic, however, many of these debates on trends and innovations came to the fore in new ways. Students' attendance at schools and universities were restricted because of the need for lockdown periods, many of which were long-term. Distance learning, instead of being a choice for particular groups of students, then became the prioritized option. Discussions emerged on how to re-configure learning spaces in a world where teaching might be neither fully online nor fully on-campus, but might be able to take place in either or both modalities (Fawns, Markauskaite, Carvalho, & Goodyear, 2021). The uncertainty brought about multiple possibilities, some scenarios requiring a learning design that can accommodate both remote and on-campus students learning together. A design might also require coping with an abrupt change of location, if lockdown restrictions are suddenly imposed, and students need to stay at home for periods of time. In sum, the pandemic brought about multiple pedagogical challenges. These were felt acutely in professional education, where the learning of practical skills in collocated scenarios seems crucial (e.g., medicine), by those for whom social interactions within educational settings are most needed (e.g., primary school) and by students at all levels of the system with barriers to learning. It also brought to the fore the need for more inclusive forms of design and coherent values-based planning (see, for example, de Rosa, 2020). Universal Design for Learning (UDL) originally developed for students with disabilities rose to prominence to provide an effective framework for design which explicitly accommodates the needs and abilities of all learners in all disciplines (Arcellana-Panlilio & Dyjur, 2021).

## Digital Inequities

Digital inequities are often characterized by the digital divide, commonly differentiated by order or level. The first order describes access while the second describes use. In recent years a third order describes the effects of use. Access to appropriately affordable and suitable technology and connectivity remains a major barrier, one made visible during the pandemic, when students were sent home to learn in extremely uneven conditions (Estefogo et al., 2021; Mawazo Institute, 2020; Fig. 2).

Second level divides reflect the kinds of economic, social and cultural capital which students have access to; this makes explicit the education with the barriers in broader social contexts. It is the third level which describes the impact and outcomes of access and use. Thus digital divides are not only digital but also social: “socio-digital inequalities are systematic differences between individuals from different backgrounds in the opportunities and abilities to translate digital engagement into benefits and avoid the harm that might arise from engagement with ICTs” (Helsper, 2021, p. 8).

Thus, it is clear that there are complex elements at play, connected to inequalities and social structures (Torabian, 2021).

When the COVID-19 pandemic began in early 2020, learning activities were suddenly redirected into a new mode, and concerns about people’s personal circumstances were foregrounded. Access to digital devices and to connectivity for learning

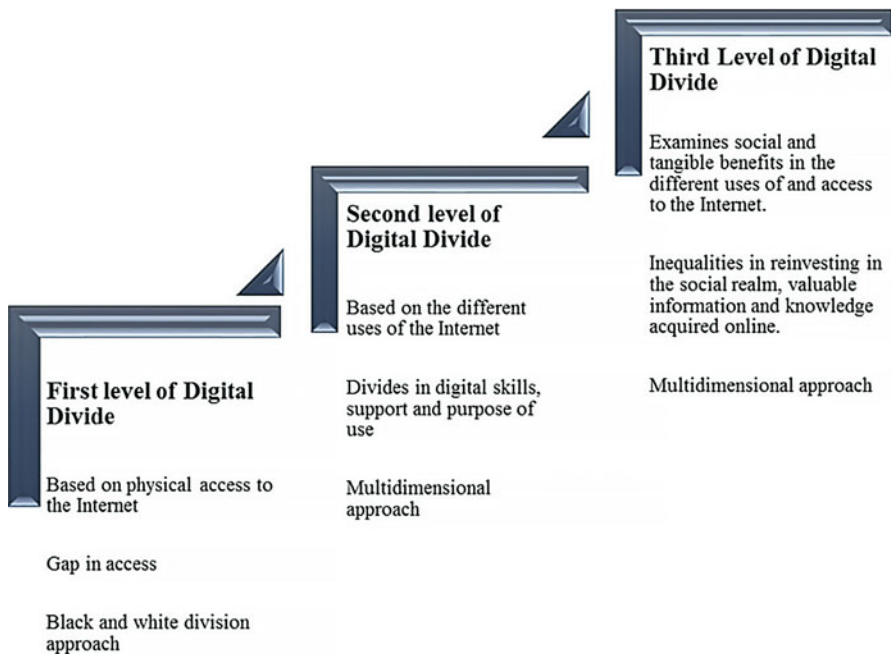

Fig. 2 The three levels of digital divide (Ragnedda, 2019, p. 35)

is extremely uneven. Across and within countries, many were disadvantaged, having no access or devices, travelling great distances for connectivity, sharing devices and being very imaginative at developing strategies for access. There were challenges associated with every level of the digital as well as a continuum of digital literacies and capabilities (Czerniewicz et al., 2020; Estefogo et al., 2021; Green, Burrow, & Carvalho, 2020).

---

## **Interdependencies Between Dimensions and Their Influence on Equity in ODDE**

The six dimensions discussed above – postdigital society and education; inequality at society at large; datafication of education; changing forms of teaching and learning provision; and digital inequities each illuminate an aspect that impacts equity in ODDE. It is at the intersection of these dimensions that entangled digital inequities exist. While separating these dimensions provides a way to see a complex picture and the array of elements at play when considering equity in ODDE, their overlaps and intersections form the nexus of lived realities and opportunities for change.

The overlay of digital practices into all aspects of life, requires people's ability to navigate living and learning as part of the postdigital world. By considering ODDE as part of practices in a postdigital society and education, we invite the reader to reflect about the consequences of having digital technologies so imbricated in life and learning. We highlight the many forms of disconnection which exclude people and which are highly likely to affect those already marginal in society. However, it is important to also emphasize that this is not an isolated issue, and that inequalities in society at large also play a role. Historical, spatial and social positioning all influence people's opportunities to access education and develop the digital capabilities they need in a postdigital world.

These wider dimensions provide a backdrop for, and are connected to, a more nuanced discussion of how digitization is impacting educational practices and equity in ODDE. The digitization of educational practices have also created opportunities for, and influenced on, how educational data is used, owned, shared, understood and made in/visible. Educational data is constantly being generated and there is a risk that education practices can be negatively influenced by algorithmic bias, predictive policing, or by encouraging surveillance and performance measurement of teachers or students for punitive or selective purposes.

In addition, the increase of digitization of society, and the datafication of education, has also impacted teaching and learning provision, where an emphasis on flexibility, cheaper studying options, reduced government funding, and massification of student populations are coming to the fore. New education practices have also been linked to the 4IR, where the need to learn how to navigate the digital realm is foregrounded, including people's ability to create knowledge to solve complex issues of the contemporary world – e.g., climate change, people's displacement and refugees, to name a few.

These dimensions have also been discussed in relation to the pandemic, and its impact on recent debates on digital trends and innovations. Some perceived and referred to a shift in education practices, when students' attendance at schools and universities had to be mediated by ODDE, which instead of being a choice for particular groups of students, became the unique option during lockdown periods. Finally, a differentiation between digital inequities was discussed, going beyond physical and material means, to include digital literacy) and social aspects that are multidimensional, and yet influence how one lives and learns in postdigital societies.

In what follows we present a way of theorizing digital participation and initiatives to provide ways forward to address equity issues in ODDE through digital inclusion.

---

## Theorizing Digital Participation

Having established that people's ability to digitally contribute and create knowledge is unevenly distributed in society, we now turn to two approaches, which can help researchers and practitioners understand and analyze these inequities: Bourdieu's theoretical framework and Sen's capability approach. Both are often used to explain and explore digital exclusion and digital participation.

Bourdieu's framework provides a way of describing digitally-mediated practices (of both educators and students) through the key concepts of "field," "habitus" and "capital." The field explains and defines the structures or systems within which individuals attempt to achieve their outcomes. It is "a structured system of social positions ... the nature of which defines the situation for their occupants" (Jenkins, 2002, p. 85). As are all fields, education is a site of struggle over resources: it is "a system of forces which exist between these positions. . . structured internally in terms of power relations" (*ibid*).

Access to all forms of capital is important because positions in the field occur in relationships of domination, subordination or equivalence to each other by virtue of the access they afford to the goods or resources (capital) which are at stake in the field. Bourdieu explains that "...the structure of the distribution of the different types and subtypes of capital at a given moment in time represents the immanent structure of the social world, i.e., the set of constraints, inscribed in the very reality of that world, which govern its functioning in a durable way, determining the chances of success for practices" (1986, p. 241).

There are four main forms of capital: economic, social, cultural and symbolic. Economic capital refers to assets either in the form of, or convertible to, cash. Social capital refers to the connections, social obligations and networks which advantage or disadvantage people. Who you know or don't know, and what assistance or leverage can be wrought relates to social capital. The next form, cultural capital, may occur in three states. For example, embodied cultural capital refers to "long-lasting dispositions of the mind and body" (*ibid*), expressed commonly as skills, competencies, knowledge and representations of self-image. Objectified cultural capital refers to physical objects as "cultural goods which are the trace or realization of theories or critiques of these theories" (Bourdieu mentions pictures, books, dictionaries,

instruments, machines, *ibid*). And institutional cultural capital is the formal recognition of knowledge usually in the form of educational qualifications. Finally, symbolic capital is appropriated when one of the other capitals is converted to prestige, honor, reputation, fame; symbolic capital relates to recognition, value and status. These different forms of capital are different forms of power, but the relative importance of the different forms will vary according to the field. One form of capital can be converted into another.

An important concept in Bourdieu's theoretical framing, is the notion of 'habitus', as the way that all the different constructs come together, the dynamic and shifting relationship between a particular field and capitals. Bourdieu explains that habitus is a system of durable and transposable dispositions, developed in response to determining structures. An individual's habitus is both involuntary (outside of their control) and voluntary (changeable). Habitus is about identity, about being in the world, is the intersection between structure and agency.

It is therefore clear that while individuals are able to exercise agency, that agency is socially constrained and is exercised within existing social conventions, rules, values and sanctions, negotiated specifically within the rules of the fields in which they operate.

Within this broader context, learning activity is often associated with people's abilities to make choices about what they value and what they would like to pursue in life (Poquet & De Laat, 2021). Having such ability is especially important when one's choices might be seen as curtailed by personal or existential circumstances. As such, the "capability approach" offers a humanistic approach to educational scenarios involving ODDE, because it provides a rationale for extending educational opportunities to include human development, well-being, and equity (Sen, 1985, 1992, 1999).

The capability approach (CA) is a theoretical framework that emphasizes human development over human capital, proposed by economist Amartya Sen and philosopher Martha Nussbaum (Nussbaum & Sen, 1993; Sen, 1985, 1992, 1999). The advancement of human capability is seen as strengthening governance, through civic engagement and citizenship. In short, CA foregrounds that the freedom to achieve well-being is morally important, and that such well-being is to be understood as related to 'doings' and 'beings', or to people's capabilities and functioning. As Sen's (1985) reminds us, people should be 'free to do and achieve in pursuit of whatever goals and values he or she regards as important' (Sen, 1985, p. 203). However, in order to fully account for people's well-being, we need to look beyond the amount of resources one may be able to access, instead considering what people are able to do and be, in relation to those resources.

Essentially, CA notions of "capability," "functioning," "freedom," "conversion factors," and "agency" offer interesting lenses to help researchers and educators frame initiatives in ODDE within an equity perspective. "Capability" emphasizes that people have individual "agency" and "freedom," but such freedom must be considered within a set of opportunities that are available to them. "Conversion factors" acknowledge that awareness of the resources available to a person is not enough in order to assess their well-being; rather, it is crucial to know more

specifically about the person and their circumstances. In addition, “functioning” is seen in relation to the resources, activities, or attitudes that people may recognize as relevant or influential to achieving their goals (Comim, Qizilbash, & Alkire, 2008). Overall, CA reminds us that what people may be able to do needs to be considered within the constraints of what they have, while also emphasizing their moral right for well-being. In the context of ODDE, people need digital capabilities that go beyond access to technologies, towards being able to confidently communicate, problem-solve, maintain themselves safely online, so that they can fluently navigate our postdigital world.

---

## **Moving Forward: Foregrounding Digital Equity**

Digital skills, literacies, and capabilities are undoubtedly essential for both educators and students in order to negotiate the teaching and learning experience, as well as to prepare for full social participation in a postdigital world. Enabling frameworks abound; two solidly theorized and practical frameworks are included here.

The Digital Capability Framework (JISC, 2018) was created to support discussions within organizations about the capabilities required in a digital world. There are six main elements in this framework which include (i) ICT proficiency, (ii) Information, data and media literacies, (iii) Digital creation, problem solving and innovation, (iv) Digital learning and development, (v) Digital communication, collaboration and participation and (vi) Digital identity and well-being. The first element is related to functional skills such as those connected to one’s ability to use technologies (ICT proficiency) and to discern between technology use, like having fluency across various tools and understanding about their suitability to achieve given tasks (ICT productivity). The second element foregrounds the critical use of technologies through the notions of information, data and media literacies. It includes one’s ability to find, evaluate, manage, curate, and share digital information; having capability to manage, access, and use digital data, and to critically use a range of digital media. The third element addresses creative production, through digital creation, research, problem-solving, and innovation. It includes capabilities connected to the design and creation of digital artefacts, the use of digital evidence to problem-solve and the ability to develop new ideas and opportunities through the digital. The fourth element is about participation through digital communication and collaboration. It includes the ability to communicate effectively in the digital realm, to contribute to group work and to participate in digital networks. The fifth element relates to one’s ability to participate and benefit from learning opportunities, as well as the ability to support and facilitate other people’s learning through the application of educational approaches in digitally-rich contexts. The sixth element relates to self-actualizing, through digital identity management and digital well-being. It includes one’s ability to develop and project a positive digital identity and to manage one’s digital reputation, to maintain personal health and safety in digital contexts.

Similar elements are also addressed in the Aotearoa New Zealand government Digital Inclusion Blueprint, a document drawing on the “Solving digital divides

together” position paper (InternetNZ, 2018), which considers connectivity as a core necessity, similar to housing, sustenance, clothing, medical care, and necessary social services. The Digital Inclusion Blueprint Te Mahere mō te Whakaurunga Matihiko (Department of Internal Affairs, 2019) provides a framework for promoting digital inclusion and equity, based on four core elements: motivation, access, skills, and trust. Motivation is about understanding why digital learning is important, the reasons for using digital technologies and the Internet and how these can be beneficial to people, helping them to connect, learn and gain access to a broad range of resources. Access involves ensuring that everyone has opportunities to use digital devices and software, as well as a reliable connection (e.g., WiFi) to access the Internet for learning, working, and everyday living. The notion of access involves affordability, connectivity, and accessibility. The development of skills relates to having the know-how to use digital media. It includes one’s ability to purposefully and meaningfully use digital technologies and the Internet. This element is closely connected to the notion of information literacy in the JISC framework, but also to the idea that technologies should not only be consumed for entertainment, but instead for creating, communicating, problem-solving, socializing, in ways that are appropriate and beneficial to people and to society. The last element in the Digital Inclusion Blueprint – trust – is connected to digital literacies, foregrounding the understanding of how to manage personal information and stay safe from scams and privacy breaches, and to be confident and resilient in digital environments.

---

## Conclusion

This chapter has revealed how equity in ODDE is at the heart of several interdependent dimensions and practices, which existed prior to the pandemic, but have now been unavoidably illuminated and more deeply entangled. It has become evident that there is a need for deeper considerations about how technology can be used to promote connections, collaboration and participation for all, as well as how to continue to encourage productive and active learning activity within varied modes, instead of reverting to “traditional” pedagogies and lecturing mode many of which were already unsatisfactory and exclusionary.

It has also become clear that there are multiple factors impacting on learning, requiring educators’ ability to design flexibility for varied future scenarios, for several modes and for a diverse student body many of whom experience barriers to learning. The need for sophisticated design is non-trivial given that it is to be achieved by an educator precariat who are themselves insecure and unevenly treated in many places together with an emerging cohort of learning designers.

Students too are being called on to perform novel tasks and develop new capabilities as they figure out how to learn under new arrangements. Their ability to do so is enmeshed in heterogeneous personal and political contexts.

Digital technologies, and indeed ODDE, must be understood as tools and practices that evolve as part of sociocultural systems, which are reflected through complex and multi-layered dimensions. There is great potential for ODDE to bring

people and different cultures together, to break down educational barriers and to foster greater participation in society. But there is also the potential for greater exclusion of those who have been already at the margins of society, deepening their lack of access to knowledge and information, making it harder for them to develop the digital capabilities they need, making it difficult for their voices to be heard, therefore perpetuating their social exclusion.

Even if educational opportunities in and around ODDE strive to promote equity through a solid grounding of values on inclusion, well-being, agency and capability development so that everyone has opportunities to contribute to our digital societies, these opportunities are also often battling other competing values, many of which reflect neoliberalism agendas that are grounded on free-market capitalism, with subtle mechanisms to maintain the control, power and status of some over others.

Researchers, educators, learners and policymakers need to come to grips with how the infiltration of technology, edtech services and new business models are leading to differentiated and inequitable systems and how institutions are reshaping the nature of what it means to be a “have-not” and a “have” in postdigital open and distance digital education. Understanding the complexity of these issues is a necessary step towards re-imagining education and building a more equitable and fair future for all.

### Abstract

This chapter provides an overview of the 11 other chapters in Section 4 of the handbook which address issues of Organisation, Leadership and Change. It pays particular attention to the impact of the Covid-19 pandemic on perceptions of ODDE, noting both the benefits of the greatly enhanced international interest in on-line learning and the negative perceptions associated with its misuse during the sudden demand for emergency remote teaching in conventional educational institutions. It envisions a blurring of distinctions between conventional and ODDE institutions with consequent opportunities for the latter. While these issues are pursued through various perspectives in the Section 4 chapters, there is a unifying theme of the critical importance of institutional leadership throughout and a concomitant focus on how leadership has to change in a rapidly evolving international context. The chapter envisions a bright future for ODDE but only if

critical issues of institutional leadership are addressed and if those leading conventional institutions are made aware of the research and experience emanating from the established ODDE sector.

**Introduction**

The Covid-19 pandemic has dramatically raised the profile of online learning around the world with both positive and negative implications for ODDE. In requiring sudden pivots from face-to-face to online learning at all levels of education worldwide, the pandemic has contributed to a blurring of the distinctions between the two and put tremendous pressures on institutional leaders to respond in new and creative ways.

While the initial intention in Section 4 was to focus on “organization, leadership, and change” primarily in the ODDE sector, these developments have raised broader questions for all forms of higher education. Central to these is the pandemic’s impact on perceptions of online and distance learning and the notion that new organizational models will necessarily emerge as it is unlikely that there will simply be a reversion to the status quo postpandemic for most conventional or ODDE-based institutions.

The importance of developing collective approaches to leadership runs throughout these chapters and highlights a widespread need for a complete rethinking of the roles and responsibilities of institutional leaders and how they are selected and assessed.

---

**The Organization of Section 4**

While the book editors suggested a preliminary list of topics, chapter authors were given considerable leeway to interpret them. The section editor selected the initial authors, some of whom engaged colleagues to assist them. The result was a deliberate mix of long-established leaders in the field, leading practitioners and emerging writers.

There was a conscious effort to represent different parts of the world in author selection while acknowledging a preponderance of writers based in Canada. Other nations represented are Germany, Ireland, South Africa, India, Australia, and New Zealand, although, as is typical in ODDE, most writers have experience in more than one national context. There was also a deliberate effort to gain developing country perspectives on three areas of research usually dominated by western writers – leadership, open and virtual schooling, and strategic planning.

Authors were encouraged to write from a global perspective but also to use their own local experiences to blend theory with practice. Unless otherwise stipulated, the discussion focuses on higher education although two of the chapters (Daniel\* and

Jha & Ghatak\*) explicitly address issues of open schooling in primary and secondary education (references to Section 4 authors are identified by the author's name followed by \* to distinguish these from external sources which are cited in the usual way).

This chapter addresses key issues of leadership and change that emanate from the 11 authors in Section 4 and offers some personal perspectives on their implications for the future of ODDE.

---

## The Impact of the Pandemic on ODDE

The Covid-19 pandemic has forcibly introduced online education to faculty and students in conventional (campus-based) universities to a dramatically unprecedented degree. Of particular interest is the impact of this phenomenon on how ODDE is perceived by faculty and students in these institutions and what impact this may have on its future. Tynan, Bossu, and Leitch\* found Covid-19 to be incredibly disruptive to faculty and their approaches to teaching and learning, with many left unprepared and forced to pivot quickly to cope.

At the outset, it is important to be clear on definitions of key terms and concepts (Nichols\*). This has been a long-standing challenge in ODDE research especially with the onset of online learning in both classroom and distance settings. For example, the move in conventional institutions has usually been to synchronous online classes (e.g., on Zoom), simply replicating the classroom experience, whereas traditional distance education has most often been about asynchronous student experiences catering to nontraditional, especially adult, learners.

It is important to recognize a clear difference between “emergency remote teaching” (ERT) and “online education” (Hodges, Moore, Lockee, Trust, & Bond, 2020). The former describes how campus-based universities, colleges, and schools the world over adapted very quickly in response to forced campus closures at the onset of the pandemic. Students suddenly were forced to learn online at home from professors or teachers who were scrambling to cope without the sort of institutional structures, instructional design, student support services, and ongoing training that characterizes ODDE institutions, the *raison d'être* of which is to cater to the needs and concerns of remote students. For Nichols\*, ERT has demonstrated what happens when the so-called distance education is suddenly used without preparation or understanding of its basics to the detriment not only of program quality but also to the reputation of ODDE in conventional settings.

This distinction is particularly important in understanding the subsequent views of online learning held by faculty and students with limited experience in that mode. While many students appreciated the flexibility this model provided, undergraduates in particular resented the relative isolation and lack of community compared to the social aspects of on-campus life they had previously experienced or anticipated. However, while a 2020 American-Canadian survey found that 58% of the students found their online experience not worth tuition costs, almost 50% of the respondents wanted some aspects of online learning carried forward once campuses reopened (Top Hat, 2022).

The student and faculty experience was particularly challenging during the first year of the pandemic (2020–2021). Courses were not necessarily designed for remote delivery, faculty felt overworked and unsupported, and many students felt deprived of some of the key social elements of a successful university experience; 2021–2022 course offerings were significantly better as universities adjusted to the new realities, providing more professional development and technological support to faculty and as students became more comfortable with their experience of distance education. However, the overall provision still fell significantly short of many faculty and student expectations.

The latter conclusion is supported by research across the globe. The pandemic has offered an almost unique replication of personal experience regardless of country. For example, early research studies in Jordan (Almahasees, Mohsen, & Amin, 2021), Poland (Bączek, Zagańczyk-Bączek, Szpringer, Jaroszyński, & Wożakowska-Kapłon, 2021) and Indonesia (Nasution & Ahmad, 2020) all concluded that, despite identified advantages to online provision, students and faculty preferred classroom-based learning. Writing in the American context, Busted suggests that “Although most students desire a return to in-person learning, the majority also want to continue having the option to take classes online” (Busteed, 2021, paragraph 4), affirming the permanence of online learning options in conventional institutions.

Further, Paul (2014) found clear examples of conventional university faculty, newcomers to online learning, developing their own research, writing, and practice without any apparent knowledge of or consultation with the established ODDE literature. The future of ODDE thus depends on concerted campaigns to promote the research results and experiences of practitioners in the field so that online learning is better understood and not tainted by the relatively poor results of ERT.

The challenges are greatest in developing countries. As Jha and Ghatak\* have shown for primary and secondary schools in India, the pandemic-driven lockdowns had a devastating impact on student persistence as both teachers and students were woefully unprepared for the demands of online education. Indeed, the forced move to online education actually exacerbated existing inequalities in educational access, especially given the unavailability of communications devices or even a place to study among so many impoverished students. The authors suggest several paths to a better future for education in India, recognizing that, despite its well-established ODDE systems, India has a long way to go to extend true opportunity to the disadvantaged.

---

## The Need for Change in Our Post-secondary Institutions

The challenges raised by the pandemic are not new but have simply amplified existing trends and concerns about higher education around the world. Among the most important issues identified by the authors:

- The costs of higher education, with governments the world over cutting budgets and leaving institutions to find their own economies (Hülsmann\*)

- Pressures for institutional diversification to provide more equitable opportunities for access and success to all, regardless of race, gender, economic, or social standing (Jha & Ghatak\*)
- Pressures for graduates to be well prepared for occupational success in the knowledge economy (Bates\*).
- Grappling with the challenges of addressing all three components of the iron triangle of educational provision – cost, access, and quality (Daniel, 2016; Daniel\*; Glennie & Paul\*).

The pandemic has not been the only crisis directly affecting our postsecondary institutions. The Me-Too and Black Lives Matter movements combined with universal concerns about climate change have complicated expectations for higher education as has an increasingly polarized political environment in many countries that threatens to undermine public trust in government and, by extension, all public institutional leaders.

Much is written about the need for “transformative” change in our postsecondary institutions but Nichols\* suggests this term is overused and that much of the achieved or envisioned change does little to alter predominant institutional structures and processes. Resistance to change is as common in ODDE institutions as it is in more conventional universities.

As Brown\* emphasizes, higher education is “entangled with a complex constellation of change forces” (p. 1) and such change is difficult, requiring knowledgeable leaders with unique skill sets and, often, courage. He decries over-simplification of such concepts as digital versus face-to-face education or teacher-centered versus student-centered learning, emphasizing that these are not binary notions, but complex concepts requiring “multifocal” leadership.

---

## **Lessons Learned from ODDE Experiences of the Past Five Decades**

ODDE has evolved with technology and the democratization of higher education to the point that it has much to offer colleges and universities of any kind. As the chapters in this section demonstrate, efforts to improve ODDE offerings over the past decades have yielded considerable knowledge about what works for distance learning at all levels of education.

Central to this challenge is the need to break through the iron triangle of accessibility, cost, and quality, especially through new technologies. Weakness in any of the three will undermine an institution’s success, but ODDE offers the flexibility that can help leaders find ways to maintain or increase accessibility without compromising either cost or quality (Daniel, 2016; Daniel\*, Glennie & Paul\*).

### **Accessibility**

The openness and flexibility offered by ODDE institutions has done much to extend accessibility to higher education in all countries, notably to previously

disadvantaged learners and to working adults. While the global pent-up demand for college and university places has made it the easiest of the iron triangle components to address, accessibility cannot be taken for granted, especially given the negative impact of ERT experiences in many jurisdictions.

## Marketing

Unfortunate ERT experiences have underlined the importance of publicizing and marketing the effectiveness of well-crafted ODDE programs, not only to the general public but to conventional university faculty and researchers so that they learn to appreciate such vital components of distance learning as course design and student support.

Jean-Louis\* notes the persistence of public misperceptions of ODDE even after 50 years of distance education – that face-to-face is de facto better, that ODDE is for self-starting individuals who don't need student support, that online is easier with fewer resources so it must be cheaper and that it is easier to cheat online so quality must be lower. These are best addressed by consistent, effective, and evidence-based communications which place a premium on creative ways of getting the message across. Jean-Louis\* offers a number of suggestions as to how this can be done.

## Cost

The piece of the iron triangle most often out of institutional control is revenue, especially for those most dependent upon government funding in an era when cuts are frequent and often deep. Glib notions that ODDE is cheaper have been seriously challenged in many jurisdictions. As Daniel\* demonstrates, this usually requires an institution to ensure enrolments (and completion rates) on a sufficiently large scale to take advantage of the cost benefits and efficiencies of ODDE.

While expanding enrolments and effective use of technology are key strategies for gaining cost efficiency, they usually require significant short-term investments and delayed benefits which can really test the fiscal stability of a given institution. This draws attention to the role and perspectives of governments and various funding agencies, an issue addressed in a provocative way by Hülsmann\* who shows how Modern Monetary Theory (MMT) can work, driven by examples of a huge influx of government spending during the pandemic. MMT allows governments to see education increasingly as an investment and, ultimately, as a profit center.

## Quality

Both accessibility and costs will be undermined if ODDE institutions are perceived to provide an inferior student experience compared to conventional institutions. This is perhaps the greatest ongoing challenge to ODDE, exacerbated by negative

perceptions of ERT spilling over to online learning in general and also by a history of low completion rates in many jurisdictions. Many of the chapters in Section 4 include suggestions as to how ODDE quality can be improved and assured.

For example, Brown\* urges reformers to recognize that digital education is not a single uniform entity and to avoid a “one provision fits all” approach. Instead, course offerings and delivery methods and even entire institutions should be customized to meet the needs of specific groups of learners.

Jha and Ghatak\* note that open schools and open universities are not for everyone because younger people may not be ready to handle the degree of independence required. And Daniel\* and Glennie and Paul\* among others reaffirm the critical importance of careful course design and effective support services for the success of students studying at a distance.

### **Professional Development**

Professional development of teachers and faculty is central to effective online teaching. Jha and Ghatak\* relate increases in transactional distance between teacher and student to the relative lack of effective teacher training for online learning.

Writing about professional development in higher education, Tynan, Bossu, and Leitch\* base their conclusions on scrutiny of a number of major research papers, emphasizing the importance of institutional context and related educational policies and teaching and learning strategies. Based on a couple of case studies, they offer eight recommendations for more effective professional development that is personalized and self-paced and accommodates individual learning styles. They conclude that just-in-time professional development opportunities enhance program participation and effectiveness. They also see a silver lining in the pandemic crisis in that previously indifferent faculty members, struggling to cope with the new realities, are increasingly welcoming professional development opportunities.

### **Strategic Planning**

After a brief review of the literature on the strengths and pitfalls of strategic planning, Glennie and Paul\* explore some of its practical challenges. The theories are strongly put to the test in a domain like South Africa where completion rates have been historically low. The authors underline the importance of defining and living up to open learning principles and diversifying to meet the needs of different groups of learners. They advocate a thoughtful and creative approach that emphasizes vision and strategy, especially for the long term, over more rigid and less effective planning exercises.

### **Partnerships**

Brown\* emphasizes the importance of strategic partnerships stemming from his experiences at Dublin City University. Porter and Perris\* distinguish among three kinds of educational partnership – propositional, cooperative, and mutual service. They go into considerable detail to show how international partnerships in ODDE, notably through the Commonwealth of Learning, and nonprofit organizations like eCampus Ontario and BC Campus in Canada, advance the collaborative use of

educational technology and digital learning environments. There are many effective models, but each partnership is unique, contextual, and subject to change.

### **Innovation**

Governments over the world struggle to find ways to encourage and benefit from innovation. This has been the lifeblood of ODDE (Bates\*) which has had to change often with the advent of each new learning technology and also to reduce per-student costs through economies of scale (e.g., large open universities, MOOCs).

Experience has shown how difficult this challenge is for governments and institutions alike. As institutions grow in size, they tend to become more hierarchical and bureaucratic, thus discouraging rather than encouraging innovation. And after making huge investments in a given technology, it is harder to change quickly in response to new needs and new technologies.

Bates\* emphasizes focusing on learning needs rather than the technologies themselves and to distinguish between sustaining and disruptive technologies. He sees innovation as seriously under-researched in ODDE literature and points to the need to overcome what he terms its destructive myths: that it is difficult, that it just happens, that it happens in a vacuum, that only creative geniuses can innovate, and that it is always good. He suggests major strategies to overcome barriers to innovation and to support innovative teaching and learning.

---

### **Implications for Government and Institutional Leadership**

The true test of leadership is the ability to change in the face of crisis and Covid-19 has been the perfect example of this challenge (Makoe\*). The pandemic has raised issues that have seriously challenged government and institutional leaders, forced to take action and then often to pivot to a contrary one with very little notice. One of the most unfortunate outcomes of this in many sectors has been an undermining of trust in leaders.

Canada is an interesting case study because of its federal-provincial model which attempts to balance central national concerns with more local provincial priorities. Given that provinces have exclusive jurisdiction over most of education and health care, the net result during the pandemic has been a considerable variety of responses across the country, with provincial premiers changing positions frequently, spawning considerable confusion, and disillusionment with government among much of the populace. This, in turn, has resulted in much more political polarity than previously and an undermining of trust in leaders at all levels of society.

Similarly, the pandemic has forced academic leaders to pivot quickly from on-campus to online and back, often without the time or inclination to consult widely with faculty or give sufficient notice to students. While such authority might have been accepted initially in a time of crisis, there is already evidence that it will not be as easily accepted in the longer term. For example, a number of Canadian faculty associations have expressed concern that more autocratic

approaches during the pandemic will become permanent, with related negative implications for future campus labor relations (Liddle, 2022).

Trust is a key requirement for effective leadership (Glennie and Paul\*, Makoe\*) and, as Brown\* has shown, embedding digital education at the heart of an institution requires collaborative and multifaceted leadership no longer so reliant on a single CEO. This emphasizes the importance of trust both up and down an institutional hierarchy.

Leaders in developing countries have additional burdens to bear, given the ongoing need to confront outdated colonial forms of governance and decision-making. Makoe\* is interested in the personality traits of leaders best able to deal with the weights of the past, the push of the present, and the pull of the future in forging a stronger higher education system for South and sub-Saharan Africa. She envisions a new class of leaders who are resilient and willing to take risks and to meet challenges in unconventional ways. This analysis rings true for wealthier nations as well.

Bates\* also cites leadership as a crucial issue for fostering innovation. He suggests that diffused leadership is usually more effective than charismatic or hierarchical approaches and leaders must be prepared sometimes to confront the prevailing organizational culture. They need to think holistically while encouraging lower-level problem solving in developing institutional strategies for e-learning.

---

## Where Do We Go from Here?

Higher education is facing unprecedented pressures for change at a time when institutional leadership is more precarious than ever.

Do the developments addressed in Section 4 possibly lead to more convergence between ODDE and conventional institutions or will they continue to develop quite separately with their own silos of research and practice? Will we see the development of new kinds of teaching institutions or a postpandemic reversion to the status quo? It will be fascinating to track differing reactions to these questions across national boundaries and by type of institution.

For Nichols\*, conventional education is based on assumptions around educational practice that are incompatible with ODDE. For this reason, efforts to mainly layer educational technology over conventional practice do not usually result in much real change. What's more, adding online learning to standard face-to-face classroom teaching has mainly increased costs, placed greater burdens on faculty members, and provided an inconsistent approach to learning for the students. In contrast, ODDE can provide much more flexibility to meet the needs of individual student learners (Daniel, 2016).

Nichols\* sees the transformation to new kinds of teaching institutions involving challenging and difficult redesign (educational operating model), redefinition (teaching roles), reengineering (processes), and realigning (practices under a new model of teaching and learning). All of these will require skilled, sensitive, and dedicated leadership.

In a world-wide climate of uncertainty, it is risky to predict developments in any field, including higher education. However, the following outcomes appear most likely from the writings of the Section 4 authors:

1. The opportunity, indeed the necessity, to forge responsive postsecondary institutions requires farsighted individuals with in-depth knowledge of all the vital components of teaching and learning for the twenty-first century. The new institutional leader will not only require the usual requisite knowledge, skills, and character, but the ability to share authority widely in building effective leadership teams and the courage and conviction to challenge even the most embedded characteristics of an institution's culture.
2. The iron triangle of accessibility, cost, and quality requires an ability to meet the challenges of all three, regardless of type of institution.
3. Through the global explosion of online learning, the pandemic has offered an unprecedented opportunity to the ODDE sector to practice and promote what has been learned from 50-plus years of research and experience in ways that both ensure higher levels of student success and offer important guidelines for institutional development.
4. Postpandemic, there will be a reversion to the status quo in the most prestigious research-intensive and teaching universities which will continue to thrive based on established reputations. But, in the long term, the most successful institutions of any type will be those that significantly challenge every aspect of their operating culture, including learning from both the successes and shortcomings of ODDE.
5. Notwithstanding negative perceptions emanating from the poor experience of many from pandemic-driven ERT, ODDE-based institutions have benefited from the pivot to online learning and will play an increasingly prominent role in the future of higher education.
6. There are important trends in many institutions to hybrid or blended approaches but, to the extent that they assume conventional operating models with no cultural change, these may constrain the potential reach toward accessible, cost-effective, flexible, open, and scalable education (Nichols\*).

Notwithstanding all the challenges and uncertainties cited above, the next decade offers huge opportunities not only for the promotion, application, and refinement of ODDE, but for its impact on teaching and learning in conventional institutions as well. If publications like this one encourage the requisite reconsiderations of all facets of educational provision, the catalyst role of the pandemic may ultimately be seen as silver lining to what has otherwise been a devastating world-wide tragedy.

### Abstract

Distance learning accelerated and diversified during the Covid-19 pandemic, with the result that individual teachers working with their normal classroom groups now account for most of the courses offered online. However, this provision of “closed distance learning” will not suffice for the needs of the hundreds of millions of people who will seek secondary schooling, degree studies, and continuing education in the next 20 years. We describe how *open distance learning* can be conducted at scale through open universities, open schools, and MOOCs, which are all designed to cope with mass demand. Our focus is on how these organizations are run. This embraces institutional design and organization, governance, management and administration, and leadership. The three types of providers have various corporate and governance structures: public open universities, open schools under the aegis of government, and commercial MOOCs companies. However, the challenges of management and administration, which are to sustain operations at scale around the clock worldwide, are rather similar. Their leadership requires a genuine commitment to serving the disadvantaged, an

## **Introduction: Distance Education Diversifies**

Distance education facilitates access to successful study. It has the potential to teach at scale and reach large numbers of learners. Since the middle of the nineteenth century, various developments, notably postal services, radio/television broadcasting, and the Internet have brought opportunities for distance learning to more and more people.

During the 2020–2021 Covid-19 pandemic, most schools and universities, few of which had experience of distance education, closed their campuses and attempted to teach their pupils and students at home. However, although this emergency switch to remote teaching required school and university staff to adapt their skills and adopt new practices, they did not have to scale up their teaching and be open to more diverse learners. Emergency remote teaching was, in effect, closed distance learning.

Most schools opted for a return to classroom teaching after the pandemic. Their experience of Covid-19, when some governments closed classrooms for many months, had shown that remote teaching was ineffective for school education. With 90% of pupils out of school during the pandemic, decades of educational progress had been reversed (United Nations, 2021). Moreover, inequalities of learning achievement, within and among countries, were further exacerbated (Daniel, 2020; Kanwar & Daniel, 2020). Long before the pandemic, however, some developing countries had established open schools to offer secondary schooling to children not reached by the conventional school systems (Daniel, 2010, pp. 110–140). Open schools could play a major role in repairing the damage of the pandemic.

Post-compulsory institutions offering higher and continuing education rode out Covid-19 more successfully. They coped remarkably well with the transition to emergency remote teaching, and, since these institutions are relatively autonomous, they adopted a variety of practices. In 2020, most instructors used video technologies (e.g., Zoom) to teach their home-based students live, but in 2021 some began experimenting with asynchronous coursework. Gauging overall student reaction to remote teaching was difficult, because some surveys were slanted to confirm researchers' biases (see, e.g., Bates, 2021). Nevertheless, student attitudes were sufficiently positive for institutions to continue some use of digital distance learning methods when teaching mostly returned to the classroom in 2022. Practices now vary widely. Some institutions mandate the same combinations of distance and

classroom teaching for all students in a group, while others offer a “hyperflex” choice of experience.

In sum, Covid-19 accelerated the diversification and expansion of distance education that had been under way since post-compulsory institutions first began to take advantage of the Internet in the 2000s. Prior to the pandemic, for example, 10% of all courses from Canada’s campus institutions were taken online. Nevertheless, within the current diversity of offerings, there remain two broad categories of practice: closed digital distance teaching by individual instructors to campus-sized classes and open distance education at scale by institutions designed to reach much larger groups.

---

## Why Conduct Distance Education at Scale?

Here, we shall focus on distance education at scale. This requires teaching and learning systems that are radically different from the congeries of practices in classroom-based institutions post Covid-19. However, given the wider availability of distance learning at all levels following the pandemic, we must first ask whether specialized institutions that conduct distance education at scale are still needed.

Distance education at scale is necessary because a growing number of people worldwide, numbering in the hundreds of millions, have no access to the education and training that might help them lead more fulfilling lives. We examine three areas of need: post-secondary education, secondary schooling for the hard to reach, and new skills and knowledge for coping with the post-pandemic world.

Goal 4 of the UN’s Sustainable Development Goals (SDGs) for 2030 embraces all three areas. It states: “Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all” (United Nations, 2015). It includes seven targets—we note two in particular:

- 4.1 Ensure that all girls and boys complete free, equitable, and quality primary and secondary education leading to relevant and effective learning outcomes.
- 4.3 Ensure equal access for all women and men to affordable and quality technical, vocational, and tertiary education, including university.

Each of these targets covers hundreds of millions of people.

Target 4.1 continues and extends to the secondary level, the global campaign for universal primary education that was launched in 1990 and given fresh impetus at the World Forum on Education for All (EFA) in Dakar, Senegal, in 2000. Some targets from that Forum were incorporated into the UN’s Millennium Development Goals (MDGs), leading UNESCO, UNICEF, the World Bank, and national development agencies to coordinate their efforts to get all children into primary school by 2015. These efforts achieved some success (UNESCO, 2016). Primary school net enrollment rose from 84% in 1999 to 93% in 2015, but progress then stalled, with 58 million children still not in school and 100 million not completing their primary studies. Covid-19 exacerbated existing inequalities. In low-income countries, only

34% of children from the poorest fifth of households complete school, compared to 79% from the richest fifth.

The primary education campaign revealed, however, that universal secondary education would be a much more challenging goal. A 2006 estimate indicated that nearly 400 million children in developing countries between the ages of 12 and 17 did not attend secondary school (Binder, 2006, p. 35), a figure that remained at 258 million in 2019 (UNESCO, 2019, p. 1). Secondary schooling is more costly than primary schooling. Indeed, Lewin (2008) found that a country is very unlikely to achieve universal secondary schooling if the unit cost of secondary is more than twice that of primary. In sub-Saharan Africa, the disparity is usually much larger, with ratios of secondary to primary costs commonly between 3:1 and 6:1 (Lewin, 2008, p. 66).

In sum, schooling remains a huge challenge. The UN estimates that in 2030 over 200 million children will still be out of school (United Nations, 2021). We shall examine later how open schools operating at scale can help to address this challenge, as well as increasing the “number of youth and adults who have relevant skills...for employment, decent jobs and entrepreneurship,” which is another Goal 4 target.

Target 4.3 is about access to tertiary education, which was absent from the MDGs. Its inclusion in the SDGs reflects governments’ increasing understanding of the contribution of tertiary education to economic and social development. With larger numbers completing secondary school and societies becoming more complex, demand for tertiary education has grown steadily. Official estimates of future demand for tertiary education have usually proved to be gross underestimates. Nearly 30 years ago, in *Mega-Universities*, the present author wrote: “population growth is outpacing the world’s capacity to give people access to universities. A sizeable new university would now be needed every week merely to sustain current participation rates in higher education. New institutions are not being created at this frequency. A crisis of access lies ahead” (Daniel, 1996, p. 4).

In this century, the demand for tertiary education has accelerated. Calderon (2018) predicts that global enrollments will grow from 250 m in 2020 to nearly 600 m in 2040. This assumes that enrollment ratios worldwide will rise from 2,700 per 100,000 population to 6,500. Moser and Ortiz-Ospina (2013) reach similar conclusions. Participation rates will grow everywhere, with the share of the 15+ population educated to degree level reaching around 50% in countries such as Canada, Finland, Singapore, and South Korea by 2050. Although these projections were made before Covid-19, its fall-out seems likely to increase demand further. However rapidly campus institutions grow in response, it seems inevitable that distance learning at scale will be a large part of the solution, not least because the global response to climate change will favor education systems that are less carbon intensive.

SDG Target 4.3 also includes post-compulsory continuing education. In this context, we shall examine MOOCs (Massive Open Online Courses), which are a twenty-first century example of conducting distance education at scale for a global audience. The number of MOOC learners worldwide was estimated at 180 million in 2020 (Class Central, 2020). They were studying some 16,000 MOOCs offered by

nearly 1,000 universities. One-third of all learners who ever registered on a MOOC platform did so in 2020, which was evidence of a pandemic-induced surge of interest in free online learning. The UK Open University saw the number of visitors to its OpenLearn website of 1,000 free courses jumps from 8.9 to 13.6 million between 2019 and 2020. Surveys showed that one in seven UK adults started an online course during the pandemic (Blackman, 2020).

The pandemic has further stimulated an appetite for learning that was already widespread. Accessible opportunities for learning at a distance should be part of the global response. Here, we examine the operational challenges of three types of distance education at scale: open universities, open schools, and MOOCs. Our focus, summarized as “running distance learning at scale,” is on three areas: institutional design and organization; governance, management, and administration; and leadership. Issues of curriculum, pedagogy, technology, and student support will be subsumed under those areas. We start by recalling the development of distance education, looking at the emergence of open universities, the concept of open schools, and the genesis of MOOCs.

The introduction of postal services led to education by correspondence in the mid-nineteenth century. This was offered mainly by commercial enterprises until the mid-twentieth century, although some public school systems (e.g., France, British Columbia) and post-compulsory institutions (e.g., London University) offered some correspondence courses alongside their classroom programs.

---

## Open Universities

Awareness of distance education expanded dramatically with the creation of the UK Open University (UKOU) in the 1960s. The slogan articulated at its foundation, “open to people; open to places; open to methods; open to ideas” (Crowther, 1969), captured its high aspirations. For as well as teaching at a distance and being “open to places,” the UKOU declared that it was “open to people” by removing all academic prerequisites for enrollment. The basis for admission was “first come, first served,” up to the capacity that the institution could cope with.

In the inaugural address, the statement “open to methods” also reinforced the expansion of access, because broadcasting on the BBC’s public radio and television channels was part of the UKOU’s multimedia teaching strategy. For Harold Wilson, the UK prime minister who launched the idea of an Open University, which he first called the “University of the Air,” openness and access were symbolized by enabling the general public to join students in watching the university teach. The UKOU was formally launched in the week of the first moon landing in 1969. Its first chancellor exhorted it to be “open to ideas” with these words: “What a happy chance it is that we start on this task in this very week when the Universe has opened! The word has a new meaning henceforward. The limits, not only of explorable space, but of human understanding, are infinitely wider than we have believed” (Crowther, 1969).

These lofty ambitions required the invention of new ways to offer tertiary education at scale, for scale was essential to the UKOU’s success. In his entertaining

account of its creation, the founding vice-chancellor, Walter Perry, records how the university stood firm on its intention to admit a first cohort of 25,000 students, despite pressure from the UK's cautious minister of finance to begin with a pilot project of only 5,000. During its planning phase, the UKOU had faced widespread scepticism, even downright hostility, in the press and the rest of tertiary education. Perry referred to "our overwhelming desire to achieve economy of scale. We felt that if our costs per student were as high as those of other universities, we would be very vulnerable" (Perry, 1977, p. 139).

Scale was an asset in many ways. In its second year of operation, with 40,000 students, the UKOU became the country's largest university. By broadcasting TV and radio programs into the nation's homes, it became a household word – and the butt of friendly jokes! Above all, the enthusiasm of the student body made the project politically unstoppable. Many early students were school teachers eager to convert their diplomas into degrees. Their high completion rates soon yielded large numbers of UKOU graduates who talked up, throughout the education system, the opportunity it offered. Within 30 years, enrollments had risen to 200,000, and when the British referred to "OU," they meant the Open University, not Oxford University!

In the following decades, concept was widely imitated. The term "open and distance learning" (ODL) began to replace "distance education." By 2010 some 50 tertiary education institutions around the world were called "open universities" (Daniel, 1996, 2019; Mishra, 2017). All were designed to operate at scale, and, even in low-population jurisdictions, they adopted the scalable organizational arrangements that we shall describe.

---

## Open Schools

It was natural that India, which had struggled to give all children primary education, let alone access to secondary schools, should pioneer a different approach. India's gross secondary school enrollment reached 50% in 2005, rose to 75% by 2014, but then stalled (GlobalEconomy.com, 2021). The Central Advisory Board for Education suggested that 15% of the secondary population be served by open schooling. India had established a National Open School as an autonomous organization in 1989. Renamed the National Institute for Open Schooling (NIOS) in 2002, it became an apex body for distance learning with responsibility for facilitating the development of a network of state open schools (Daniel, 2010: pp. 116–122).

The NIOS is very successful. It has 2.2 million pupils enrolled and admits 350,000 annually. However, the situation of the state open schools is more patchy. In his study of their development, Rajagopalan wrote:

Taking an overall view, one cannot escape the conclusion that with very few exceptions, the State Open Schools resemble atrophied limbs of the State Education Department. They are like rudderless ships set adrift in a sea of low morale. This is a poignant situation when one considers the immense potential of SOSs to bring about a sea-change in the social set-up and improve the economic well-being of the underprivileged people. (Rajagopalan, 2011, p. 4)

Earlier, the same author had reviewed the development of India's state open universities and concluded: "The State Open Universities in India reveal a picture of diversified growth. The first state OU, established in 1982 in Andhra Pradesh, started off well with many programmes and dynamic leadership during the first few years. Unfortunately, however, a situation of complacency and bureaucratic control has dominated the scene in the recent past" (Rajagopalan, 2007).

Rajagopalan's conclusions highlight an important challenge. Large-scale distance education operations are not easy to establish and run. Visionary and energetic leadership is needed to launch them, while their implementation and maintenance depends on first-rate management, efficient administration, and determined commitment to students, most of whom have more difficult lives than those able to go to school. The creation of distance education institutions intended to serve large underprivileged populations by top-down administrative fiat is not a route to success.

---

## Massive Open Online Courses

MOOCs are our third manifestation of large-scale distance education. Around 2010, some university computing academics seized on the Internet to attempt computer-based teaching across the globe (Daniel, 2012). It recalled the moment in the mid-nineteenth century when the inventor of Shorthand, Isaac Pitman, decided to teach his new language by correspondence using the newly created postal service.

Although universities use information technology extensively, they realized that to offer MOOCs they would need outside help to maintain computer-based teaching systems that could operate worldwide, 24/7, with very large enrollments. New organizations, such as Coursera (USA) and FutureLearn (UK), were created for this purpose.

As enthusiasm for MOOCs burgeoned, the initiating universities realized that they could not satisfy the demand by relying solely on their own academics, some of whom were skeptical of MOOCs anyway. They invited other universities to join the enterprise, suggesting that offering short courses to large global audiences would be an attractive way to enhance their brand, even if the economics of the MOOCs themselves were—and still are—uncertain. A definition of a MOOCs is "a course of study made available over the Internet without charge to a very large number of people: anyone who decides to take a MOOC simply logs on to the website and signs up" (Oxford Dictionaries Online, 2021). This definition highlights the "easy-come-easy-go" nature of MOOCs. Nevertheless, although completion rates are usually dismal, the huge worldwide enrollments in MOOCs indicate that they are a useful part of the open distance learning ecosystem.

As more players jumped on the bandwagon, the definition of each word in the acronym MOOC lost precision, as nicely captured in a famous poster by Mathieu Plourde (2013) of Laval University. Our analysis of MOOCs will focus on FutureLearn, which was formed as a for-profit entity by the UK Open University in 2012, with the Australian employment marketplace company, SEEK, becoming a

50/50 joint owner in 2019. By 2021 FutureLearn counted 250 partner organizations and over 10 million registered users (FutureLearn, 2019).

Building on this background, we explore the challenges of running distance education at scale under three headings: institutional design and organization; governance, management, and administration; and leadership.

---

## Institutional Design and Organization

Despite the different organizational arrangements required for open universities, open schools, and MOOC providers, they have the common feature of serving a mass clientele. Adam Smith, an eighteenth century economist and moral philosopher, pioneered modern thinking about designing for mass demand. In his classic, *An Inquiry into the Nature and Causes of the Wealth of Nations*, he described how the industrial revolution scaled up manufacturing. Taking the example of a pin factory, an early manifestation of the transition from cottage industries to mass production, he summed up the radical changes as follows:

This great increase of the quantity of work which, in consequence of the division of labour, the same number of people are capable of performing, is owing to three different circumstances; first, to the increase of dexterity in every particular workman; secondly, to the saving of the time which is commonly lost in passing from one species of work to another; and lastly, to the invention of a great number of machines which facilitate and abridge labour, and enable one man to do the work of many.... (Smith, 1776)

The analogies to the provision of education at scale are clear. The “dexterity of every particular workman” translates to the creation of teaching systems that integrate a range of specialized functions in an effective manner. “The saving of time... lost in passing from one species of work to another” means that the various specialists and partners can make their inputs at different times, which speeds up the overall process. Lastly, contemporary information and communications technologies provide us with “a great number of machines” to facilitate the tasks of both teaching and learning.

These parallels led the German scholar-practitioner, Otto Peters, to describe distance education as an “industrial form of education” (Keegan, 1994). However, his work began to be cited in the 1990s, as the world entered a post-industrial era. For some, the industrial or “Fordist” era recalled faceless drones on soulless assembly lines, whereas the idealists of open and distance learning saw themselves as the dynamic pioneers of a new era of education. This provoked a robust debate in the scholarly literature about Fordist and post-Fordist approaches. An article by Raggatt (1993), “Post-Fordism and Distance Education: A Flexible Strategy for Change,” was an example.

Comparing the course development and production methods used in distance education at scale to Model T Ford assembly lines may seem far-fetched, but authors like Raggatt had a point. The 1990s was a period of significant curriculum change in

all areas of education. For some topics, it was no longer appropriate for large course teams to take many months to develop standardized distance learning materials and offer them for years with only minor revisions. More flexible approaches were needed to allow quick updates. Fortunately, making these in online courses was easier and cheaper than reprinting materials.

Nevertheless, division of labor, standardization, and partnerships are core strategies for distance education at scale. Open universities now offer shorter courses and develop them more quickly. Open schools closely track their countries' developing curricula and can rapidly offer newer areas such as vocational education (Daniel, 2010, p. 118). Their economies of scale are increasingly impressive. The cost per pupil of India's NIOS was less than one-twelfth of those at conventional schools (Rumble & Koul, 2007, p. 128).

For MOOC platforms, division of labor means having their partners' organizations develop the courses following centrally established guidelines for format and quality. This author has taken 20 MOOCs (from 12 partner institutions) of the 2,500 courses that FutureLearn has offered. A common format makes navigations of the courses easy, while allowing the character of each partner institution and the strengths of its academics to shine through. FutureLearn's social learning platform has attracted 35 million inputs.

These scale providers have remarkably lean core operations. India's NIOS has a central staff of 250 for over two million pupils. The tutors and mentors who support the pupils work in 11 regional centers and 3,260 study centers located in accredited institutions of various kinds (Daniel, 2010, p. 117). For ten million registered users, FutureLearn has a core staff of 130, relying on its 250 partner institutions for course development and academic support.

Although the open universities do not outsource academic tasks as much as open schools and MOOCs providers, they also operate efficiently. To serve its 200,000 students, the UKOU has 1,000 full-time academics, 4,900 part-time associate lecturers, and 2,500 support and administrative staff. For comparison, Oxford University, with 24,000 students, has 14,500 staff, of which 1,700 are academics.

The UKOU made an important innovation in academic organization. Perry (1977, p. 205) noted that:

Universities in general do not have a hierarchical structure of government. They are essentially cellular in nature, each cell representing one academic discipline or department... The UKOU made a significant break from this normal system. Responsibility for individual teaching programmes... is vested in course teams, which are set up for the purpose. Nevertheless the course teams are, for their lifetimes, just as much cellular components of an overall structure, as are departments in other universities.

In open universities, the academic structure is a much smaller part of the total institution than on campuses. The large sections of open universities dealing with operations – regional structures, production processes, and student administration – are hierarchical rather than cellular. We discuss the challenges that pose for governance below.

## Governance, Management and Administration

There are two reasons for treating these three functions together. First, they are less distinct in large-scale distance teaching operations than in classroom teaching institutions. Second, they are arranged differently in our three organizations of interest, which have different ownership structures.

With a few exceptions, open universities are public institutions, although without substantial government involvement in their day-to-day affairs. The UKOU's royal charter gives it the same legal status and protections as the older universities. Open schools, on the other hand, are mostly departments of national education ministries, with mixed results, as noted in the comment by Rajagopalan (2011, p. 4) that some "State Open Schools resemble atrophied limbs of the State Education Department." By contrast, FutureLearn and the US MOOC provider, Coursera, are for-profit commercial enterprises.

Distance education at scale can be conducted successfully under various corporate arrangements, provided that they give the organization enough autonomy to respond to the needs of its clientele and influence the selection of its leaders.

Open universities are usually governed by some variant of the bicameral structure of board and senate common in higher education. Perry (1977, p. 206) described the particular challenge that this posed for the UKOU, which occurred partly because its planning committee had anticipated that there would be relatively few full-time academic staff, with the university using specialists on secondment for much of the course preparation. On this assumption, the committee recommended that all full-time academic staff be members of senate. In the event, the university made little use of secondments for course development, so the full-time academic staff grew much larger than anticipated. When the author joined the UKOU as vice-chancellor in 1990, the senate had over one thousand members, although this was reduced to 100 in the 2000s. The larger body may have made decision-making a bit slower, but this was more than offset by faster implementation because of wider buy-in to the decisions. Furthermore, students and part-time tutors, who had significant representation on senate and attended assiduously, ensured that decisions usually reflected students' interests.

The governance of open schools is simpler. The eight open schools profiled by Daniel (2010, pp. 110–140) are all directly linked to state ministries of education, although their success seems to correlate well with the degree of independence in governance and operations that the reporting ministry affords them. India's NIOS has achieved a good balance. It follows government rules for the terms and conditions of staff but has the General Body of NIOS, chaired by the minister, to set policy, with an Executive Board to oversee operations. Ferreira (2009, p. 195) commented: "it is not coincidental the NIOS, the largest open school in the world, is not only the most autonomous of our case studies but also the most open in terms of academic regulations... and alternative vocational curriculum."

Botswana's open school, BOCODOL, is a parastatal body (i.e., a semi-autonomous public institution run on commercial lines). This is also a successful formula, and BOCODOL is embedded effectively in the national education system.

The open school in neighboring Namibia, NAMCOL, is also a parastatal body, but very subservient to the ministry of education, limiting its ability to plan its own future. However, the case of Papua New Guinea, where the open school started as part of the University of PNG but is now attached to the ministry of education, suggests that the ministry is a more appropriate home, because UPNG used to skim off part of the open school's fee income to spend on its own campus operations.

MOOCs providers operate as commercial operations for profit, although FutureLearn is 50% owned by the UKOU, which is a public university. MOOC providers have boards of directors in the normal commercial manner. The greatest challenge they face is to make money from learners and partners without straying too far from the original ideal of making courses freely available globally on the Internet.

The acronym MOOC originated in Canada in 2007 to describe an open online course at the University of Manitoba titled, "Connectivism and Connective Knowledge," (Downes, 2012). It was offered to 25 fee-paying students on campus and 2,300 members of the general public who took the online class free of charge. It aimed to follow Ivan Illich's injunction that an educational system should "provide all who want to learn with access to available resources at any time in their lives; empower all who want to share what they know to find those who want to learn it from them; and, finally furnish all who want to present an issue to the public with the opportunity to make their challenge known" (Illich, 1971, p. 75). In this spirit, "all the course content was available through RSS feeds, and learners could participate with their choice of tools: threaded discussions in Moodle, blog posts, Second Life and synchronous online meetings" (Daniel, 2012).

Most of the thousands of contemporary MOOCs are inspired more by Silicon Valley and Wall Street than by those pioneering approaches, although, as MOOCs diversify, learners may have more latitude to mold them to their own needs. The principal challenge is that MOOCs are costly to create and yet, according to a standard definition, "they are made available over the Internet without charge to a very large number of people." Providers have explored various ways of monetizing MOOCs, including all of the following:

- Certification (students pay for a badge or certificate).
- Secure assessments (students pay to have examinations invigilated (proctored)).
- Employee recruitment (companies pay for access to student performance records).
- Applicant screening (employers/universities pay for access to records to screen applicants).
- Human tutoring or assignment marking (for which learners pay).
- Selling the MOOC platform to enterprises for their own training courses.
- Sponsorships (third party sponsors of courses).
- Tuition fees.

As a result, MOOC companies can have viable businesses, although this list suggests that the organizations least likely to make money are their partner universities. This may not really matter, however, because campus universities offering a

few MOOCs may be happy to treat them as “loss leaders” that burnish their brand and show off their liveliest academics, always assuming, of course, that their MOOCs are attractive and academically credible. From my own experience, FutureLearn’s development and quality assurance processes ensure this, and they sometimes have a transformational impact on the teaching strategies of the academics taking part.

While these three types of providers of distance education at scale have different governance structures, their management and administration have many similarities, largely because of the imperative of operating at scale. Large-scale learning systems are analogous to three-legged stools (Daniel, 2010, pp. 57–60). The legs are administration and logistics, course materials development, and student support. All teaching institutions have functions analogous to these, of course, but most classroom-based teaching can continue reasonably well if one—or even two—of the legs are weak. However, for distance education at scale, the stool is an apt metaphor, because if any leg is weak, the whole system may collapse and students will desert it.

Perhaps surprisingly, given their very different contexts, the practices of our three-scale providers are rather similar in the administration and logistics functions. This is because they all need to operate high-capacity IT systems for student records management and other functions. For example, in 2008, long before any widespread use of computers in its teaching, 30% of pupils in India’s NIOS were enrolling online, a facility now available through the common service centers in the country’s 600,000 villages (Daniel, 2010, p. 119). Moreover, when the heads of open universities from around the world met in Toronto in 2017, they agreed that: “IT can prove most useful in the administrative and student support functions. Speeding up these processes has positive impacts on student progression and retention” (Daniel, 2019, p. 203).

How are courses developed for distance education at scale? MOOCs providers delegate course preparation to their partner institutions, offering whatever support is necessary and quality assuring the result. Over a decade, FutureLearn and other MOOCs platforms have refined successful formulae for course presentation which integrate short (5–10 min) videos, podcasts, texts, research articles, simulations, quizzes, and interaction among students on the social learning platform. This decentralized approach is the key to offering thousands of subjects and, since each partner institution only contributes a small number of courses, it has an interest in making them engaging and impressing the learners.

Open schools also arrange for most course development to be done by external specialists and leading organizations in the field. NIOS has been a pioneer in developing vocational education and, to promote the concurrent development of the hand, head, and heart, offers life-enrichment courses such as music, painting, art, and yoga. It is determined to give an appropriate place to life skills and a focus on the world of work, hence its decision to enable students to combine vocational and academic courses (Daniel, 2010, p. 118).

Although some courses are shared among India’s state open universities, the tradition of developing open university courses in-house remains strong. Perry

(1977, p. 90) considered the course team to be the UKOU's most significant innovation, and this tradition continues:

Modules are developed by multidisciplinary course teams comprising:

- Academics, educational technologists, and media specialists contributing pedagogic and technical expertise.
- Respected academics from other universities working alongside OU colleagues.
- External examiners.

This model has helped to build the University's reputation for innovation, rigour and quality and has been adopted by distance teaching institutions worldwide. (Open University, 2021)

The provision of student services and support is where the differences between providers of distance education at scale are most marked. As with course development, the open universities mostly keep this function under their direct control. The UKOU informs its students of these services on its website:

The OU has a network of more than 5,000 tutors – the largest in the UK. Tutors mark assignments, provide detailed written feedback, and offer support to students by telephone, email, or computer conferencing. They also run group or online tutorials and day schools. Some are full-time members of staff, but most are associate lecturers: experts in their subject who combine their work as tutors with other academic or industry jobs. (Open University, 2021)

The organization of this tutorial network is a vital and sensitive function. In the early days, its administration was decentralized to 13 regional centers, where each program area located a full-time academic. As programs multiplied, however, more tutoring moved online and, when the UKOU encountered financial difficulties in the 2010s, only the UK's nation regions retained such centers, creating an internal controversy that became national news.

Most open school pupils are of secondary school age, although these institutions also attract adults who missed out on schooling for various reasons. Whether younger or older, however, these pupils require more intense and regular support than learners in higher or continuing education. India's NIOS conducts personal contact programs of 30 hours (35 for science subjects) at study centers on weekends, holidays, and convenient times during the week. These study centers, numbering over 3,000, are run by local institutions that NIOS accredits. Most are non-governmental organizations (NGOs) with missions to disadvantaged children or those with disabilities. This creates win-win partnerships, since NIOS has access to study centers that share its aims, while the NGOs can offer schooling to the children alongside their main mission.

For MOOCs providers, student support is entirely delegated to the partner institutions, except for regular electronic communications from the center to encourage learners to stick with their courses, enroll for new ones, or pay to convert them to formal qualifications. Each course in FutureLearn has an active social learning platform, where partner institutions monitor comments and intervene if discussions get off track or spread misunderstandings.

## Leadership

We end with the challenge of leadership. Large-scale distance learning providers have corporate structures ranging from those nested in government through independent not-for-profit universities to commercial for-profit entities. Are there common qualities that the leadership of such diverse organizations requires?

In “Open Learning and Open Management: Leadership and Integrity in Distance Education,” Paul notes the need for different sorts of leadership depending on the institution and the circumstances. While individuals with a strong vision and communication skills can respond to major change more effectively than those whose leadership qualities are less obvious, they may be less effective in coping with longer-term adjustments to the change (Paul, 1990, p. 20).

Effective leaders must have the flexibility to adopt the approach required by the particular situations they face. Anyone who has moved among senior posts in different institutions knows this. For example, the author recalls the sharp contrast between the challenges he encountered as vice-president of Canada’s Athabasca University (AU) in the late 1970s and those he faced as vice-chancellor of the UKOU in 1990.

Established in 1970, AU was still finding its way gingerly into distance education by the end of the decade. Arriving in 1978, the author found a senate that wanted to change the direction of the academic program at every meeting. To slow this spinning wheel, he argued that determined implementation of a reasonable option would take AU further than waiting to conceive a perfect program. The staff, clearly relieved, set to work on implementing senate’s most recent plan and AU took off, with enrollments doubling every year.

The situation the author found in the UK in 1990 was quite different. The UKOU was already an international icon conducting distance education at scale in a highly effective manner. However, energy was low and the staff were depressed after a decade of a Thatcher government, not because of cuts in funding but because the minister had launched a witch hunt for Marxist bias in UKOU course materials. Moreover, in the wider world, the honeymoon period of distance education inspired in by creation of the UKOU had ended. Critics began to ask how much of a revolution it really was. The Fordism debate captured the *Zeitgeist* of the times. The vice-chancellor’s first task was to restore confidence and energy. Thatcher had just left the stage, so another imperative was to rebuild relations with the government, which was planning a major reform of UK higher education—although we were unaware of that in 1990.

In a later book, Paul (2015) takes an ethnographic approach to the leadership of Canadian universities in the period 1990–2010, with a good summary of the academic literature on leadership generally. In the light of this literature and his personal experience, this author considers that the leadership needed for distance learning at scale is determined as much by the conjuncture that the institution faces as by any personal vision that a new head brings. In particular, a leader needs these five qualities:

- *A conviction that the institution can be a catalyst for global change*

In ODL, such convictions often embrace openness, widening access, and using technology, but Perry came to the UKOU with a different ambition: “I had long been concerned at the pitifully inadequate standard of most of the teaching that went on in the established universities” (Perry, 1977, p. xv). He believed that if teaching at a distance could develop a better approach, “it should ultimately spread back into the established universities and raise the standards of teaching everywhere.”

- *The skills and determination to sustain excellent relations with government*

This goes beyond the self-interested relationships that all executive heads of public institutions like to have with their government. Because they can roll out new programs nationwide with consistent quality, institutions operating at scale are natural partners to help governments implement their own objectives for education and training programs. This has been successful in jurisdictions as diverse as Indonesia (training of teachers and health-care workers) and Quebec (PERMAMA) (Daniel, 2010, p. 146).

- *Familiarity with the administrative and bureaucratic functions of the institution*

As our analogy with a three-legged stool illustrated, large institutions will underperform unless course development, logistics and student support all work well. Since these are scale operations, any changes must be carefully planned. The UKOU experienced a serious hiccup in the mid-2010s when it expanded online tutoring with insufficient pilot testing. Leading a large distance learning organization is a full-time job, which requires constant attention to multiple functions.

- *Ability to scan the environment and anticipate the implications of technological developments*

Using the most appropriate teaching and organizational technologies is central to the mission of a distance learning institution, but false moves will be costly, and needed changes take time. This is a huge challenge for open schools and open universities, where the speed of change is essentially determined by the equipment that students can access at home.

- *Persuasive advocacy for new initiatives*

Absent special funds to launch additional programs, new initiatives require temporary sacrifices of resources by existing units, which usually see the emergence of a new area as a threat. It is the leader’s task to persuade colleagues of the institutional benefit. An example of success is the UKOU’s law degree, now the most popular in the UK, which was a late addition to the university’s programs.

## Conclusion

The Covid-19 pandemic stimulated dramatic diversification and expansion in digital distance learning, as schools and universities around the world switched rapidly to emergency remote teaching. Although much teaching returned to the classroom as the pandemic receded, the new capabilities for distance education that teachers and institutions have acquired will be helpful in responding to the huge growth in demand for education and training foreseen in the coming decades. We have shown that even partial achievement of the UN's Sustainable Development Goal 4 will bring hundreds of millions of new pupils, students, and learners into secondary schooling, tertiary studies, and continuing education. The new capabilities for distance education that campus institutions have developed, although useful, will be insufficient to meet this demand. It will require organizations that can offer distance learning at scale in a spirit of openness. We have explored three examples, open universities, open schools, and MOOCs, focusing our attention on the operational challenges of running such providers, which already account for millions of learners worldwide. These organizations bring other important assets as the world recovers from Covid-19 and addresses three major challenges: reducing the inequalities within and among countries, helping those pushed back into poverty by the pandemic, and fighting climate change.

Our three types of scale providers of distance education all have the mission of offering ready access to learners of all types, an approach that the campus institutions switching to emergency remote teaching did not try to adopt. The term “*open* and distance learning” originated with the scale providers, and openness will be a crucial feature of educational provision in the twenty-first century. A primary element of openness in distance education at scale is to operate at lower costs than campus institutions. In doing so, it leaves a much smaller carbon footprint and can help the whole education sector combat climate change.

Although open universities, open schools, and MOOC platforms each have different ownership and governance arrangements, they present similar challenges of leadership, management, and administration. For institutional success, the three key functions of course creation, student support, and logistics must all function impeccably around the clock and on a large scale. This requires leaders and managers who are wholly committed to the ideals of openness and teaching at scale rather than the comforts of selective admission and small classes.

### Abstract

This chapter examines the reach and experiences of virtual and Open and Distance Learning (ODL)-based education in the context of developing countries with high socioeconomic inequalities and highly uneven access to literacy and technology, through a study of the ODL experience in India. Using the perspective of inclusiveness, the chapter first examines the available evidence related to the virtual schooling experiences during the ongoing COVID-19 pandemic. The pandemic made virtual schooling suddenly a reality in the entire country, as has been the case in most parts of the globe. It then moves to analyze the available evidence with regards to the existing ODL-based system in India, which also happens to be one of the largest in terms of the numbers covered through this mode in the world. Based on these analyses, the chapter identified three kinds of thresholds: access related, learning related and systems related, to outline the prerequisites for the success of virtual or open schooling, especially from the

perspective of those who belong to educationally disadvantaged groups or locations and face marginalization of some kind. While arguing for making the ODL-based education far more inclusive and responsive to specific disadvantages, the chapter recognizes the need for the mainstream regular school system to become more flexible and open by learning from the ODL-based education system. Finally, the chapter argues for the need for adopting a proactive and layered learner support approach in order to ensure that virtual teaching actually leads to meaningful learning.

**Introduction**

“Those were the Days” is the title of a lesson in the Hindi language textbook for the fifth grade in India, published first in 2007 by the National Council of Educational Research and Training. This Hindi adaptation of a science fiction by Isaac Asimov visualizes children’s lives in the year 2155 when schooling is entirely in front of a “machine,” and is thrilled to see a printed book that they accidentally discover. The book was from their grandparents’ time. This, however, became a reality much sooner than 2155, in 2020. The COVID-19 pandemic suddenly advanced and widened the use of technology in education in many parts of the globe, making the notion of virtual schooling far more common than anyone could have anticipated. This also led to the realization of both the potential and limitations of open and virtual learning in diverse contexts, including developing countries.

This chapter uses the research evidence from India to argue that the success of the open and virtual education initiatives or systems at the level of school education is dependent upon the presence of a number of structural, locational, educational and technological thresholds, especially in contexts that are highly socio-cultural-linguistically diverse and economically unequal. It argues that, in absence of these thresholds related to literacy and literate environment of the learner, affordability of the resources such as internet accessibility and the associated hardware, technological connectivity, and freedoms regarding time-use and access to phone or other tools, the reach and potential of open and virtual schools remain limited. What is true for India is likely to be true for a majority of developing countries in general, and for South Asia in particular. Therefore, this chapter provides an illustrative case for understanding the limitations and potential of Open and Distance Learning (ODL)-based school education in the developing world.

Using the Indian case as an illustration, it goes on to argue that exclusive open or virtual schools cannot and should not replace physical schools at the school-education stage because the learner in most cases is still not an adult and therefore does not have freedoms that one needs to access open schools, although the

open-school approach and practices have something critical to offer to make the physical school system a less rigid, inclusive, and creative spaces for learning. Open and virtual schooling practices can play a complementary role by widening the experience range of the learner in addition to its potential for certification of those who cannot or do not want to be part of the regular schooling system.

The rest of the chapter is divided into three main sections. The following section discusses the evidence regarding the experience of virtual schooling during the pandemic and the next section uses the available evidence and feedback on the established system of ODL-based schooling structures and experiences. The final section presents the conclusions and prerequisites for making virtual and open schooling-based education more responsive and inclusive in developing countries.

### **The COVID-19 Pandemic Experience**

As the world turned toward online education hailed as the only option left for education in this crisis, so did India, when it went into a sudden and complete lockdown from 24th March 2020 to curb the spread of the COVID-19 virus. The lockdown was a measure to protect an already fragile health infrastructure, causing the educational setup to go into an overwhelming shock when all schools were abruptly closed. It has been well documented that school closures and periods of long holidays tend not only to negatively affect learning and school attendance but also can push children to labor, trafficking, and long-term dropouts from the school (Dove, Wong, Gustafson, & Corneil, 2020; Denney, Gordon, & Ibrahim 2015; Selverbik, 2020; Santos & Novelli, 2017; United Nations Development Programme, 2015). Therefore, an unprecedented, long and sudden closure of schools witnessed during this pandemic is already showing clear signs of adverse impact on learning levels and increased rate of drop outs at the time of writing this chapter. UNESCO estimates that about 140 million students in primary and 130 million in secondary schools have been affected by the lockdown in India alone (UNESCO, 2020).

The New Education Policy (Ministry of Human Resource Development, 2020) in India had laid down the intentions toward greater use of online education into the regular teaching learning practices but the pandemic situation peddled online education as the “only solution.” Almost overnight, it was expected that the entire school education system would be able to convert itself into a digital, distanced-based system ready to serve the masses, with no preparation, no infrastructure, no social motivation or culture for self-directed learning. While ODL-based education or virtual schooling provides a viable option for continuing education in times of crisis like these, especially because of its potential for avoiding crowding, it also calls for training and adequate preparation. Although India has a well-established ODL-based education delivery system through its network of National Institute of Open Schooling (NIOS) and state-specific State Open Schools (SOS), the mainstream schooling system has rarely taken advantage of it in terms of learning from its processes and experiences. Hence, when the challenge of suddenly shifting from physical to virtual came, most of the schooling systems in India stumbled, as

evidenced from diverse feedbacks that have emerged from the field. Before discussing this experience, it is important to understand the kind and range of virtual schooling options that have been available in the country.

A perusal of the literature suggests that there are four kinds of online media and tools that are currently at use in India. The first is digital ed-tech content platforms like Byjus, Vedantu, and Topper. These platforms offer technologically assisted coaching, content delivery and assessments to learners at a moderate to high cost depending on the package purchased. The second kind are social media platforms such as YouTube, Facebook, Twitter, and Instagram, which offer content through videos, blogs, and links to papers that learners can access free of cost as per their need. Virtual meeting spaces are the third kind of medium used by learners which offers a community space for interaction between learners, teachers, and other stakeholders. The most widely used virtual meeting platforms like Zoom, Google Meet, WebEx, and Microsoft teams are mostly free or come at a nominal charge. The fourth kind, and probably the most accessible because of its low-tech nature and cost, are broadcasts of lessons for relevant classes in television by national and various state governments and portals like DIKSHA E-Vidya (Sharma, 2021). These mediums offer a combination of synchronous and asynchronous platforms for learning. There has been an unprecedented jump in the number of users for these media and tools during the lockdown (Mathivanan et al., 2021).

The flexibility of learning in the comfort of one's home and the option to learn at a time most convenient for the learner serve as the biggest advantages of online learning. Added advantage is that the learners can stay connected 24 h a day and have the flexibility to choose from a variety of content available online and also to explore various teaching aids such as videos, graphics, posters, recorded lessons, as per their learning needs. Therefore, it offers learners the autonomy and freedom to learn anytime and anywhere as per their own pace and requirements. These freedoms are also extended to the teachers who can choose from different kinds of content, course structures, teaching aids, and materials available online. Teachers can also opt for different kinds of innovative assessment systems that are easily available online to suit their teaching requirements and assessment parameters (Cojocariu, Lazar, Nedeff, & Lazar, 2014; Muthuprasad, Aiswarya, Aditya, & Jha, 2020).

Modern technology allows for a variety of customization that enables collaborative work and an interactive learning environment (Dhawan, 2020), giving rise to blended and flipped classrooms. Technological innovation in Educational Technology (EdTech) has now allowed for real life simulations that replicate multiple features of a classroom allowing for an alternate learning space that was hard to imagine a few years ago (Kumar, 2021). The neoliberal market structure also allows for greater competition between the various online platforms and helps keep prices in check. But in all this, to assume that the mere availability of reliable internet connectivity and a laptop or a smart phone would ensure schooling and continued learning for all has been proven wrong in a country like India, whether examined from the perspectives of physical or social access, or viewed from the angle of pedagogy and learning.

## Access to Virtual Schooling

India is a country where diversity and disparity go hand in hand. With over 250 million learners who are currently in school and many more who are of school age but outside the schooling system, India has one of the largest school-going populations in the world (Statista, 2020; Unified District Information System for Education Plus, 2020). This population is spread across diverse landscapes, regions, ethnicities, and cultures. When intersected with multiple social structures of caste, class, region, religion, and gender clubbed with high regional disparities and disproportionate access to resources, online learning becomes not only unequal but also difficult to either execute or access. Access to virtual schooling can be divided into two broad categories – firstly, physical access to digital infrastructure – like computers, smart phones, and internet connectivity, and secondly, social access to online education like having the time, space, and negotiating power to learn. A perusal of various data sets and surveys conducted pre- and post-pandemic clearly shows that both kinds of access are available only to a small section of the population and those coming from the most marginalized sections remain excluded from virtual schooling.

The 75th round of the National Sample Survey Office (NSSO) in 2020 on social consumption of education conducted in 2017/18 pointed toward the persistent digital divide in India. The data showed that only 9% of the students within the age group of 5 to 35 who were surveyed had a computer with internet access. About 11% of the students reported having a computer at home, while 25% said that they had access to internet facilities. The data also showed a vast rural-urban divide where only 4% of students in rural India claimed having access to a computer with internet as compared to 21% of students in urban areas. Regional disparities in access were also stark especially when seen in connection with rurality. Only 1% of students from rural areas had access to digital infrastructure in five Indian states: Jharkhand, Karnataka, Odisha, Tripura, and Telangana. The presence of Karnataka in this list, which has relatively better economic and social indicators with its capital Bangalore known as IT capital of India, shows that the access to online media does not always follow a linear pattern of regional deprivation (Reddy, Jose, & Vaidehi, 2020).

The digital divide, nevertheless, strongly intersects with economic and social divide in a society. The students belonging to the top income quintile had the highest access to computers with internet in India. As per NSSO (2020), about 45% of students belonging to the richest 10% income quintile reported having essential digital infrastructure as compared to only 2% of students from the lowest income quintile reporting the same. This trend holds true for the socially marginalized sections of Scheduled Tribe (ST), Scheduled Castes (SC), Other Backward Classes (OBCs), and Muslim students who reported having very limited access to computers with internet (4% for SC and STs, 8% for Muslims, and 7% for OBC). These groups have traditionally been at the lowest end of educational development and are officially recognized as the same. These numbers, when compared to students from other categories where 21% reported access to digital infrastructure, reveal that the digital divide is deeply rooted in socioeconomic deprivation. These four

groups form more than 70% of the population in India, and therefore it will not be wrong to assume that, without access to essential digital infrastructure, learners from these populations would largely remain outside the gambit of virtual schooling and would have been left behind in continuing their education during the COVID-19 pandemic.

The interconnectedness of gender with other social and economic marginalization makes girls and women the least favorable group when it comes to accessing online mediums of education. Social norms strictly guided by patriarchal practices prevent women from not just owning technology, but social idioms of nature versus nurture and values attached to women's domesticity makes access to technology and online learning almost impossible for women in general, but especially for those who belong to the most marginalized populations in India. India has the highest gender gap in access to technology of any country (Devara, 2020).

A survey conducted by the Centre for Budget and Policy Studies (Ghatak, Yareseme, & Jha, 2020) to assess the impact of the pandemic on the lives and education of children where one child in the age group of 10–18 years and one adult was interviewed from 3176 households across four Indian states found that in more than 70% of the households, the phone belonged to a male member. The gendered access to technology was revealed when only 26% of the girls who responded to the survey said that they had unhindered access to phones at home in comparison to 37% of the boys. The number of children who reported unhindered access went up when the phone belonged to a female member of the family, possibly because the male members usually ventured outside for work, hence further restricting access. This access declined further with economic deprivation, where children from households reporting economic difficulties reported less access to phones in comparisons to households that were relatively better placed economically. Children from such households could not afford to recharge internet packages even if a phone was accessible to them.

Several studies conducted in the pandemic period showed similar results. For example, two studies reported that only 11% of the children watched educational programs tele/broadcasted by state or union government; this was despite the fact that more than half of the households had a television set at home (Ghatak et al., 2020; Rajgopal & Gupta, 2020). Furthermore, girls spent disproportionality longer hours on domestic chores as compared to boys, and as a result, they had less time for studies and found it difficult to match the time for television broadcasts of educational programs which often coincided with their domestic responsibilities.

The results of another survey conducted to gauge the early impact of the pandemic on children in 23 Indian states by interviewing school going children from classes 1 to 12 also showed that access to digital infrastructure was limited with only 43.9% of children having access to smart phones (Bahl, Bassi, & Arora, 2021). Only 30% of students enrolled in public schools from the state of Maharashtra used the government's digital online platform. Less than 1% of the students had a laptop or a computer at home. Further, the students came from backgrounds with limited online learning environment where more than 70% of the parents reported having no digital skills (Bahl et al., 2021). An online learning environment also requires a private

space for learning which is often absent for children coming from marginalized sections as they mostly live in modest living conditions with shared spaces amongst multiple siblings and relatives. Private space for learning is a luxury in India available only to a small proportion of socioeconomically privileged populations (Shah, 2020).

What is clearly evident from these studies is that online education or virtual schooling, when seen as the only viable option for continuing education during situations of crisis like the current pandemic, led to further widening of the already existing inequality in access to schooling. These studies established three facts: firstly, the physical access to devices necessary for virtual schooling is very restricted; secondly, the mere presence of physical devices in the household does not guarantee real access; and thirdly, social structures posed major barriers to unhindered access to virtual schooling.

### **Challenges of Online Pedagogy**

Online pedagogy in many ways is qualitatively different from pedagogies followed in regular face-to-face interaction-based classrooms and therefore requires alterations in teaching and learning processes. The nature of technologically mediated platforms demands that teachers and learners have a certain ease with technology, going beyond rudimentary technological literacy. Grasping the interest of the learner and maintaining it for the length of the classes in which learners and teachers interface through a small screen, and face constant interruptions due to power cuts and inconsistent internet are some of the most challenging aspects of online teaching and learning (Cherian, 2020; Dhawan, 2020; Song, Singleton, Hill, & Koh, 2004). In addition to these challenges, one must also note that the issues of access that the students face are true for teachers as well, especially female teachers.

Even though online virtual classrooms try to replicate features of regular physical classrooms, it could lead to various levels of alienation for the teachers and the students. With the collapsing of spaces, where there is no difference between the place of work with one's private space at home, female teachers are often faced with situation where they are expected to be attentive toward domestic responsibilities and work around the clock (Chandy, 2020; Economic Commission for Latin America and the Caribbean & UNESCO, 2020; United Nations, 2020). Thus, trapped into a chain of unending work exasperated by the challenges of using a medium for which most of them have received very little training and therefore seemingly foreign, it is understandable that the teachers themselves can feel quite alienated.

Under such circumstances, it is not unusual for transactional distance to be high. In simple words, transactional distance is a psychological and communication space between what was taught by the teacher and what the learner perceived and understood (Moore, 1997). Therefore, high transactional distance could add to a sense of alienation between teacher and student, which is multiplied by the physical distance between them. A survey based on the experiences of 212 teachers from rural and urban India found that most teachers perceived high transactional distances in online

teaching, where they found themselves to be untrained to handle situations in dealing with students from varied learning capabilities (Singh, Satyavada, Goel, Sarangapani, & Jayendran, 2020). From the learner's perspective, another level of alienation is the limited space provided for peer learning, interactions, relationship building, and expression of feelings through online mediums of education. Unlike the physical classroom space, the online space provides very limited avenues for the students to laugh, fight, question, and develop a sense of comradery and community (Bhattacharya, 2020).

Studies trying to see if children have been able to retain their learnings that they had achieved prior to school closure reported significant "learning losses" during the pandemic despite potential access to virtual schooling. A study covering 16,067 children in 1137 public schools in India across classes 2 to 6 reported learning-loss for more than 90% of children in language and more than 80% in Mathematics for selected foundational abilities that are critical for further learning (Azim Premji University, 2021).

It is hence clear that virtual schooling experiences were not successful in sustaining the learning, which could be a result of both access and pedagogy related challenges, and the unpreparedness of all: institutions, teachers, and students. But what happens when there is a preparedness? The existing ODL-based schooling system delivered through the NIOS and SOS have evolved over a long period of time and should have developed mechanisms to address some of these access and pedagogy-related challenges that they too are likely to have faced. The next section discusses this in detail.

## **The ODL-Based Schooling System in India**

Unlike virtual schooling that suddenly came into practice during the pandemic, the ODL-based schooling in India uses a combination of other modes in addition to technology such as printed learning resources as self-learning materials and contact classes with teachers. With more than three million enrolments, India's ODL-based schooling facilities are considered one of the largest in the world. This is something that the literature from the community of ODL professionals always like to highlight in the context of scale (Ferreira, Kanwar, & Daniel, 2008; Kanwar & Ferreira, 2012). However, the formal ODL-based education covers only 2 to 3% of the school going population in India. Although not meant for only the school going population age group, an overwhelming majority of the NIOS and SOS learners at secondary and senior secondary, especially the latter, come from the same age group that also attends regular schools.

The NIOS works through state-specific regional centers which manage all the local functions including conducting face-to-face contact classes and examinations. The NIOS system provides flexibility that the regular schooling system usually does not provide. This includes the provision for (i) a five-year time period to complete the courses such as secondary (grade 10) or senior secondary (grade 12), (ii) no maximum age specified, making it easy for older people who could either not attend

or complete their schooling, and (iii) twice a year public examination with an additional provision for on-demand examinations. The question then is whether these provisions and flexibilities help those in accessing education who have otherwise remained excluded from school education? The existing research shows a mixed response to this question: while it is true that many individuals who have studied using this mode would not have accessed schooling in absence of the ODL system, it is also true that the representation of rural or educationally backward groups remains low (Jha, Ghatak, Minni, Rajagopal, & Mahendiran, 2020).

The three officially acknowledged, educationally backward social groups, rural areas, and remote locations that are relatively poorly provided with schooling facilities and girls remain under-represented in the NIOS as well. The SCs, STs, OBCs, occupying about 70% of the population have had only about 29–33% representation at the secondary stage, and 25–29% at the senior secondary stage, which also does not seem to be improving over time (NIOS Statistical Reports, Different Years). The same is true for girls; they represent only about 30–31% of total NIOS admissions at both stages and their shares have remained almost static during 2008–2015 (National Institute of Open Schooling, Different Years).

The question that arises in this context is why it is so? The available evidence shows that only a small section has been able to use the flexible elements successfully and the groups that are the most natural targets of the ODL system have not benefitted as much. The specific analyses leading to this inference are discussed below.

Using the multi-nominal logit regression to estimate the probability of completion where the dependent variables represent completion at varying time periods since enrolment (say 1 year, 1.5 years, and so on) and no completion and the independent variables included sex, age, caste, mother's and father's education, income level, while using the NIOS student's data for 5 years (2008–2013), Jha, Ghatak, Minni, Rajagopal, and Mahendiran (2020) estimated the probability of completion over the course of the stipulated 5 years and concluded that

...an average learner faced a higher probability of non-completion, of about 45%, even with the five-year flexibility. The probability of successful completion is highest in the first year of enrolment (about 25%). After that, the probability decreases to 17% at the one-and-a-half-year stage of enrolment and falls alarmingly to 7% in the second year of enrolment and then to 2% thereafter. In other words, the majority of those who are likely to complete the course do so in the first two years, implying that the use of the five-year time frame has been very low. (p. 146)

This implies that majority of learners who complete the courses do so in the very first year or at most the second year. The probability of those of completing who do not complete in 2 years is low. Could this indicate the presence of more of those who are substituting regular school with ODL just for certification rather than adding to the existing pool of in-school students? This question becomes important, as many view ODL-based education as an alternate mode to reach a higher number of out-of-school children as well as to provide an opportunity to those who have missed the bus (Ferreira et al., 2008; Kanwar & Ferreira, 2012).

Based on an in-depth study of the ODL system and experiences including an analysis of student data and a tracer study, (Jha et al., 2020) conclude that this is indeed the case. This argument is based on several evidence bases including the fact that: (i) the majority of the institutions for contact classes are located in urban and per-urban areas; (ii) technology that plays a major role in admissions, accessing learning resources and examination, remains inaccessible to most learners from marginalized backgrounds, aided by structural barriers faced by girls, as discussed in the earlier section; and (iii) information/literacy gaps including poor English language skills necessary for accessing technology-enabled resources and services make learners more vulnerable to exploitation by middlemen, which also makes the cost of accessing the system unaffordable. Consequently, they argue that ODL-based education, which also serves as an examination board, is being used largely for certification alone rather than learning. The users include: (i) experimental schools and NGOs that are either looking for creative combinations and flexible arrangements, not offered by the regular school boards; (ii) “high-performing” institutions that push students who are not likely to be high achievers in the regular examination boards; and (iii) institutions which primarily coach students for entrance to engineering and medicine courses, alongside providing senior secondary stage education.

What emerges is that while each learner is treated as an individual learner by the NIOS, in reality, a good proportion is using it only for certification while their learning is mediated by other institutions. This means that these learners do not depend upon the NIOS resources and services for their learning, performance, and completion. The available statistics, however, do not tell us about the distribution of NIOS learners across different kinds of learners. Research also indicates that there are wide deviations in the NIOS delivery “as envisaged” and “as practiced” at all stages: pre-admission, admission, academic support, and examination. Awareness drives about ODL-based education and assistance for technology rarely take place in rural and remote locations; contact classes are infrequent or nil in certain states and facilities like examination on-demand are available only in regional centers located in the state capital or other prominent cities (Minni, Pancharatnam, Rajagopal, & Jha, 2016). In absence of any support and mediation, it is difficult for the individual learners facing various constraints and living in remote areas to learn on their own. Even though online spaces can potentially allow collaborative learning, the absence of access to facilities coupled with lack of agency and freedom of learners makes it almost impossible for this to be practiced (Jha et al., 2020).

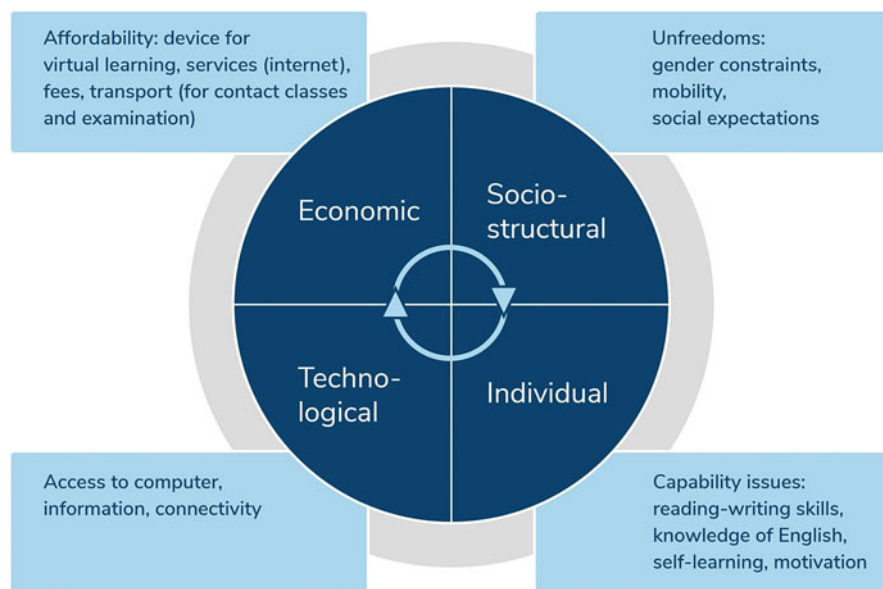

What becomes apparent is that the barriers to virtual schooling that have recently been exposed on the face of the pandemic have also been at play in limiting the reach of the already-existing ODL-based schooling systems. While many, including those who faced individual barriers such as early marriage or early labor market entry have used the system to further their schooling (Mahendiran, Ghatak, & Jha, 2016), those who are at the margin do not make it to thresholds needed to access the open schooling. Only better-informed and more privileged take advantage of the openness and flexibilities to get away from the otherwise rigid system of schooling. The final section discusses how the ODL-based system can be made less distant for the

vulnerable, and how the rigid schooling system would benefit by borrowing a few principles and processes from the ODL system of education.

### **Inclusive ODL-Based Education and Flexible Schools: Developing Countries Potential Pathway**

The discussion so far clearly reveals that while ODL-based education needs to be become more inclusive and accessible, the mainstream system of schools that push away students who do not completely “fit,” needs to become more flexible. Developing countries need to make all learning spaces, either based on ODL or face-to-face schools, more open, inclusive, and creative. The lack of flexibility and preparedness of the existing schooling systems was a major reason for the near failure of virtual schooling in helping children from marginalized groups access learning opportunities that otherwise should have been accessible to them. Here, the ODL system has a lot to offer. However, the ODL system itself needs to be more aware of the needs the learners form educationally disadvantaged groups and the barriers they face to be able to make its delivery more inclusive and meaningful.

The above discussion can be summarized in the form of three kinds of threshold that the success of the ODL-based school level education is dependent on: access, learning, and system-related thresholds (Fig. 1).

**Fig. 1** Constraints that learners need to overcome for reaching the access threshold required for ODL

## Threshold 1: Issues of Access

The following diagram presents the access related constraints faced by learners to reach a threshold allowing them to access ODL-based education in its present form. These are somewhat similar yet distinct from what one faces to access the regular school. For instance, knowledge of particular levels of reading-writing skills, practice of self-learning, and high motivation are not as essential in a physical classroom, as the teacher is expected to mediate the process and help in filling these gaps. Similarly, girls face even greater restrictions as at times the choice itself is determined by the fact that the family does not want them to be mobile, and they even restrict their access to devices such as phones (Ghatak et al., 2020; Jha et al., 2016). Greater dependence on technology in the ODL system makes the issue of connectivity and affordability far more important there.

## Threshold 2: Issues of Learning Support

The effectiveness of learning through virtual means is highly dependent on the presence and effectiveness of the access related thresholds discussed earlier. While economic, socio-structural, and technological thresholds are critical for accessing the process of teaching, individual barriers are crucial for using the process for learning to happen. In other words, the delivery design and system need to take all these constraints into account. For instance, if both connectivity and affordability are a major issue for a group of children in accessing internet/computer-based virtual classes, it is important to think of and include alternatives such as textual learning resources. Similarly, if girls are known to be engaged in household chores during morning hours in their households, the TV/radio broadcasts can be scheduled for the afternoon, when a higher number is likely to attend.

However, even when all these barriers are overcome, individual barriers may continue to play a major role in learning: the learner may still be unable to make sense of the connections between what is being taught and shared learning resources because of the absence of mechanisms that allow teacher-learner interactions, mediation, questioning, and a deeper engagement through peer interactions. The literature on the ODL-based education has been engaging with this issue and a “Self and Strength” based learner support approach (Simpson, 2008) seems to be particularly relevant in developing countries where children from marginalized groups face poverty, low self-image, absence of a literate, and supportive home environment and gender-based discrimination.

A learner support system that uses elements of Dweck’s Self Theory to help students believe in their own innate ability to learn, and also from the Strength Approach by having a continuous relationship with students through proactive means such as phone (or letters if phone and internet are not available) to ask about their well-being, strengths, and need for support shows evidence of having a positive impact on learning levels of ODL learners coming from marginalized

backgrounds (Simpson, 2008). The schooling system, which continues to be heavily dependent on virtual means due to the pandemic, can pay attention to these elements not only now but also for building its general preparedness for any such shocks in the future as well as for better integration of children from disadvantaged backgrounds in regular schools. For ODL systems this would mean a shift from the current approach where the learner rather than the system is supposed to be proactive; the near absence of a “teacher” or an advisor or mentor in ODL systems at school-education stage prevents any kind of learning from becoming central as learners are still largely young and hence not necessarily highly independent, motivated, and skilled.

### **Threshold 3: Issues of Systems**

The evidence from Indian case clearly shows that the current system of ODL-based school education is working well for those learners who are self-motivated and proactive, especially for certification. This means that, though the flexibilities (number of years, on-demand examination, combination of subjects/discipline to be selected) have been very useful for those who had learned enough to complete the stage and get a certification, this is something that the regular systems normally fail to accommodate. However, the ODL-based system has neither been successful in having contextual and diverse approaches to be able to expand the reach for educationally disadvantaged groups nor in enabling learning for those who are not supported by other institutions as mediators.

---

### **Conclusion**

The above analysis points toward the need for three critical shifts to make the ODL-based school education inclusive, flexible, and effective for those learners who come from disadvantaged contexts. Although drawn from the analysis of its experience in India, these are likely to be a common issue across the nations at similar stages of economic development and having similar levels of heterogeneous or unequal societies. These are: (i) ODL systems adopting more inclusive measures for better access, for example, using diverse means to reach potential learners taking specific disadvantages into account; (ii) encouraging the mainstream systems of schooling – schools and the examination boards, to think of adopting a few flexible measures by learning from the ODL systems, such as allowing for a flexible time frame for completing a level without any stigma of completing it over a longer time-frame, and making space for creative combinations in subjects in schools using hybrid modes if teachers are not available for all subjects; and (iii) both the regular school system and the ODL-based school education systems need to pay much greater attention to adopting layered and responsive approaches for supporting learners proactively in any virtual learning space.

### Abstract

This chapter reflects on the challenges and opportunities of leading educational change in today's digitally connected world. It offers personal insights and critical reflections on learning leadership framed by a wide-angle, multifocal lens that helps zoom in and out to visualize preferred futures. Before outlining a collection of leadership touchstones and critical questions for guiding institutional transformation and then reporting their application in the practice of digital education, the chapter begins by illustrating how the new learning ecology is complex and entangled in competing images of the future. Efforts by educational leaders to build agile and sustainable transformative organizational cultures need to be guided by a clear sense of direction and anchored in a living institutional mission. The role of the National Institute for Digital Learning (NIDL) hosted at Dublin City University (DCU) in Ireland is central to this story, as harnessing the transformative potential of new digital technology is at the heart of its change

agenda. After briefly introducing DCU, the chapter reports how the NIDL's commitment to leadership development and active engagement in global networks are helping to reshape the higher education landscape with a critical digital edge. However, forging a future-focused mission based on multifocal criticality and transformative leadership is not something for the faint-hearted; it requires agency, relational capital, and strategic foresight to move from digital in part to digital at the heart of your organizational culture.

**Introduction**

The need for leadership has never been more apparent. Even before the global pandemic, the demand for more flexible models of higher education was growing worldwide. In most countries, there has been a significant COVID bump adding to the drive for greater flexibility, with online education having never been more in focus. Indeed, it remains high on the agenda as educational leaders grapple with the forces of digital disruption and how to respond to the “great onlining” of higher education (Bozkurt et al., 2020).

Steering a path from being a COVID fixer to visionary future-maker with a compelling narrative for learning transformation is challenging work, especially as digital higher education is entangled within a complex constellation of change forces. The current language of reimagination set against the legacy of the pandemic needs problematizing as it reflects a kaleidoscope of competing perspectives with different images of the future. A unique type of multivision is required to critically “read” these images and help paint your own preferred learning futures, combining strategic big picture thinking with local foresight. This type of wide-angle, multi-focal lens enables those in leadership roles to view different perspectives and navigate a path between the language of opportunity, set against the need for deeper criticality.

The chapter begins by challenging one-sided distorted images of the future. Importantly, it rejects sweeping generalizations of the field as digital education is not a single uniform entity. Indeed, Singh and Thurman (2019) reveal 46 different definitions of the term “online learning” alone. Without adding fuel to the definition wars, the chapter argues that binary debates and polarizations of the field are unhelpful. They do little to critically untangle the tensions and many different threads of digital education as educational leaders attempt to craft their own counter narratives. Instead, higher education needs to be understood as a wider social practice. The future is rarely black or white, as leading change usually requires trade-offs, blurring of boundaries, and the weighing up of alternative options guided by longer-term desired outcomes.

From this multifocal perspective, educational leaders need to focus on the big ideas they want to achieve as well as the smaller details of how they plan to put them into practice. To this end, building a culture of learning transformation depends on developing leaders throughout an organization with a strategic mindset and agile implementation playbook. To help shift current thinking away from higher education being in a state of change to the enabling language of higher education for change, a collection of leadership touchstones and critical questions is described to help frame future thinking. The chapter situates this leadership perspective in an institutional context by reporting several examples of learning transformations in action. Through the DCU/NIDL experience, it illustrates the value of cultivating critically, growth minds and strategic networks, and partnerships to support organizational development. However, leading transformative change in such uncertain times is not for the faint-hearted. Promoting learning transformation that places the ever-changing digital world at the heart of your mission depends on untangling competing futures, a strong sense of agency, and the actions and relationships forged with many different people.

---

## Competing Images of the Future

New models of digital education are often portrayed on a binary axis rather than reflecting a far more messy and complex reality. This false binary operates on several dimensions. The most obvious form is across delivery modes (i.e., online vs. off-line). Pedagogically, the binary is often framed in terms of the distinction between acquisition and participation metaphors of learning (Sfard, 1998), or put more simply, teacher-centered as opposed to student-centered learning. This distinction rarely acknowledges:

Because no two students have the same needs and no two teachers arrive at their best performance in the same way, theoretical exclusivity and didactic single-mindedness can be trusted to make even the best educational ideas fail. (Sfard, 1998, p. 11)

Ideologically speaking, the discourse surrounding digital education is usually framed within one of two basic worldviews: the tradition of the Learning Society; and the influence of the Knowledge Economy (Brown, 2016). Although overly simplistic, these worldviews serve as a metanarrative that simultaneously infuses and funnels the competing languages of persuasion which seek to establish the common sense, define what counts as legitimate areas of agreement and disagreement, and shape the future choices and opportunities facing educational leaders.

To better illustrate this binary, new flexible models of digital learning provide a real opportunity to reduce costs, enhance quality, and address increasing global demand for higher education. They provide the opportunity to break the so-called “Iron Triangle” (Daniel, Kanwar, & Uvalić-Trumbić, 2009) and realize the vision of “universities without walls” (EUA, 2021). In the future, it will be almost impossible to meet the projected growth in demand for higher education worldwide through

traditional “bricks and mortar” models. Despite well-documented inadequacies of emergency remote teaching (Hodges, Moore, Lockee, Trust, & Bond, 2020), the COVID response has demonstrated three key points.

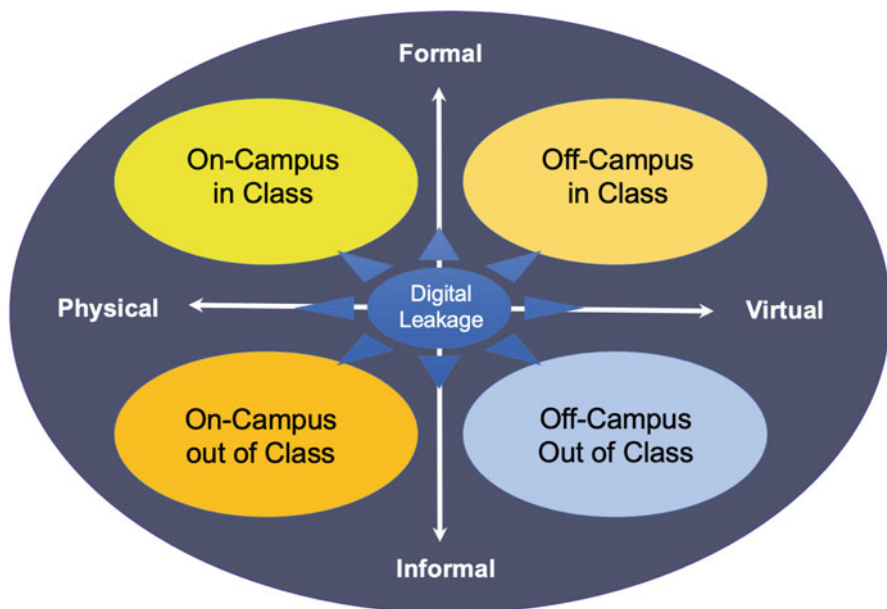

First, online learning was able to successfully facilitate access to higher education for those affected by campus closures. Learning did not stop during lockdown. Second, it highlighted the potential of new digital models of learning to help expand access to higher education for people unable to study through more traditional methods. Third, online learning is now a viable and increasingly mainstream alternative for people wishing to upskill and earn as they learn. Even before the pandemic, Gallagher (2021) reports that about half of all corporate learning in the United States was being delivered in an online or mobile mode, and that this figure has increased significantly over recent years. Notably, in the 30 days prior to June 2020, the major MOOC platforms attracted almost 500 million visits from learners around the globe, up 2.5 times from January (HolonIQ, 2020). Thus, online delivery is now an established feature of the learning landscape and is key to meeting increasing global demand for higher education.

On the other hand, new digital models of education inhabit the contested terrain of marketization, platformization, and commercialization (Brown, 2021a). In many countries, delivery of online education often “. . . involves public universities partnering with, or using the services of, private companies” (Morris, Ivancheva, Coop, Mogliacci, & Swinnerton, 2020, p. 3). COVID appears to have accelerated this trend with Teräs, Suoranta, Teräs, and Cruncher (2020) claiming that the pandemic has “. . . created a sellers’ market in ed-tech” (p. 863). Williamson, Macgilchrist, and Potter (2021) argue that a key characteristic of the educational response during the pandemic has been the growth of new commercial platforms and public-private partnerships promoting the use of Ed-Tech for profitable market returns. There are also growing concerns about the automation of education (Selwyn, Hillman, Bergviken Rensfeldt, & Perrotta, 2021a), the rise of platform pedagogies (Perrotta, Gulson, Williamson, & Witzemberger, 2021), and the surrender of control to surveillance technology (Selwyn, O’Neil, Smith, Andrejevic, & Gu, 2021b). The rise of “big tech” is often linked to powerful neoliberal forces such as the unbundling movement, which is arguably creating a new learning economy (Ralston, 2021). According to this line of critique, higher education is taking the form of a commodity, a product, or service, marketed and sold to customers like any other commodity.

While these are important concerns, despite such broad generalizations, the pandemic has also reopened old debates about whether traditional ways of teaching are better than online learning. By analogy, imagine for a minute that following the lifting of COVID travel restrictions, two tourists have flown to Ireland (Brown, 2021b). On the same day, they are standing on the famous Ha’penny Bridge on the river Liffey in the center of Dublin looking upstream into the future. While they are both standing at the same vantage point, what they see is quite different. One sees sparkling water reflecting off the bright sunshine. In contrast, only hours later, the second tourist sees dark shadows and a dirty, polluted river, as the tide has turned and the sun has disappeared. The Liffey does not look very attractive. However, both are accurate reflections of the Liffey.

The two images illustrate how the good, the bad, and the ugly of new models of digital education coexist simultaneously. They also serve to illustrate how digital education is part of a complex learning ecology and why such binary positions are unhelpful. The reality of the hope and the hype of digital education is far more muddled as the current flows both up- and downstream with increasing leakage across the different places and spaces of learning. This point is illustrated in Fig. 1. It shows four quadrants of learning where students can learn on campus in formal classroom settings, on campus in informal out-of-class contexts, off campus in formal in-class settings, and off campus in informal beyond class contexts (Brown, 2015).

In summary, digital education is polythetic with many different faces. While the benefits of new flexible models of education do not disappear on the tide, nor do they magically transform more traditional or impoverished forms of pedagogy. For that matter, on-campus, in-class education also has many different faces and not all of them warrant “Gold Standard” status. Therefore, little can be gained from naïve comparisons or sweeping generalizations of both off-line and online delivery modes, without sufficient consideration of the educational context. Returning to the above analogy, a complex mix of factors add the sparkle to the Liffey, including the role of leadership. Therefore, a multifocal view of leadership is crucial to better understanding these factors and reframing one-sided distorted images of the futures.

**Fig. 1** Representation of the new digital learning ecology (Brown, 2015)

## Developing Multifocal Leadership

Good leadership matters. While the interpretation of “good” is open to debate, a wealth of literature exists on impactful approaches to leadership (Fullan & Scott, 2009) and leadership development (Dopson et al., 2019) in higher education. A growing body of literature is also emerging on leadership in the overlapping fields of e-learning (Miller & Ives, 2020), online learning (Fredericksen, 2017), digital transformation (Miller, 2019), and educational technology more generally (Arnold & Sangra, 2018). Moreover, there is evidence of border crossing between this literature and key lessons for leadership in higher education arising from the COVID crisis (Laufer et al., 2021). A detailed review of this literature is beyond this chapter, but there has been a general trend over the past two decades to placing greater attention on microleaders, the role of middle-out leadership, and developing more distributed models of institutional leadership. In theory, gone is the day of the “lone ranger” leader charging ahead from the front. If the goal is to implement lasting educational change, then leadership depends on the big and small actions of many different people (Childs et al., 2013).

While it is important to intentionally craft your own leadership style, learning to lead is messy. There is no simple manual as educational change is contextual and rarely follows in a straight line. Thus, a wide-angle, multifocal lens helps educational leaders to better see the curves, complexities, inter-dependencies, and underlying tensions of the choices they face in rapidly changing times. Such a lens in one’s leadership toolkit helps to reveal possible, probable, and preferred future scenarios that steer a path through tricky political and slippery ideological terrain. This type of lens also helps to examine images from many viewpoints and go beyond false binaries. The ability to zoom in and out and see the challenges and opportunities facing the sector from many viewpoints is central to the concept of multifocal leadership. As Kanter (2011) writes:

To get a complete picture, leaders need to zoom in and zoom out. A close-in perspective is often found in relationship-intensive settings. It brings details into sharp focus and makes opportunities look large and compelling. But it can have significant downsides. Leaders who prefer to zoom in tend to create policies and systems that depend too much on politics and favors. They can focus too closely on personal status and on turf protection. And they often miss the big picture. When leaders zoom out, they can see events in context and as examples of general trends. They are able to make decisions based on principles. Yet a far-out perspective also has traps. Leaders can be so high above the fray that they don’t recognize emerging threats. Having zoomed out to examine all possible routes, they may fail to notice when the moment is right for action on one path. They may also seem too remote and aloof to their staffs. The best leaders can zoom in to examine problems and then zoom out to look for patterns and causes. (p. 112)

A commitment to being a learning leader and leader who learns is foundational to developing multifocal leadership. This perspective recognizes leadership as inherently a cognitive process and involves cultivating an adaptive learning organization. From this perspective, the following personal touchstones characterize the qualities of multifocal leadership:

- Being ambitious, developing a growth mindset, and staying at the forefront of the literature to identify new and emerging trends
- Valuing debate, alternative viewpoints, and understanding how the language chosen to use really matters
- Sharing one's own mistakes and creating a culture of openness where making mistakes is a normal part of the leadership process
- Being personally accountable and ensuring open and transparent communication in decision-making
- Understanding that resistance is a valuable source of insight and that the real light comes through the cracks
- Leading with both the head and the heart and helping other people feel the passion and personally walking the talk
- Promoting diversity within one's team, with a particular emphasis on developing agency, supporting emerging scholars and distributed leadership
- Making explicit plans that are fully owned, on mission with achievable goals and sharing regular progress updates with key stakeholders
- Recognizing the power of the network by building strong professional relations and strategic partnerships
- Developing strategic foresight through self-review and scenario planning tools to identify major change forces and preferred futures

While striving to implement these touchstones remains a personal work in progress, the ability to zoom in and out is framed around seven critical questions. The following questions adapted from a seminal book on *Educational computing as a social practice* (Bromley & Apple, 1998) have influenced the author's leadership over more than two decades:

- Who is telling the story?
- What are we being told?
- Why are they telling the story?
- How are they telling the story?
- Who has the most to gain from the story?
- What is missing from the story?
- Whose story is not being told?

These questions recognize that leading any change involves "crucial struggles" over competing futures and who should control the curriculum, indeed the very meaning of education itself (Apple, 2019, p. 277). More recently, Facer (2021) adds an even deeper level of analysis to these questions:

What and whose knowledges are being used to create these ideas of the future and where are the absences? What processes were used to make these ideas of the future, and why? How does this work address the necessity of decline as well as the possibilities of the new? What are the injustices upon which futures are being envisaged and how are these being addressed? How do principles of intergenerational justice inform the practice? Who will

attend to the consequence of these ideas of the future being put into the world and how? What is the role of these futures in creating hopeful politics and practices in the present? Might these futures be used for pathological and extractive speculation, if so, how might this be prevented? How can the distinctive temporality of education be preserved not subordinated to the futures proposed? (p. 2)

The challenge when zooming out to such big and confronting questions is to steer a path with a strong moral compass that avoids being a leader caught in the headlights. Asking critical questions is one thing but going from critique to action is another. A sense of personal agency is required to develop local actions that move beyond paralysis and the risk of being overshadowed by the pedagogy of the depressed. In this respect, the above characteristics of multifocal leadership are framed in the language of hope and opportunity. Striking this balance is not easy as it requires educational leaders to untangle competing futures, carefully pick their priorities and achieve short-term victories without losing sight of the long view. As Scott, Coates, and Anderson (2008, p. 73) remind us:

Developing and implementing desired change is not an event but is a complex and subjective learning/unlearning process for all concerned.

Talking about leadership theory is one thing, but translating it into practice is quite another. At this point, therefore, attention shifts to how one university with a tradition of expanding access to higher education responds to the challenges and opportunities of the new digitally connected world. This final section reports how DCU endeavors to be a future maker. It briefly describes the strategic architecture and then outlines several recent efforts to harness the potential of new digital technologies to deliver on its core mission of *Transforming Lives and Societies*. In telling the DCU story, the intention is to illustrate multifocal leadership in practice and how the above questions have helped to implicitly guide the actions of many different people in developing a transformative learning culture.

---

## The DCU Story

DCU is a relatively young university. It offers over 200-degree programs to almost 20,000 full-time equivalent students across five faculties. DCU hosts Ireland's only Faculty of Education and one of the largest in Europe, with more than 4,000 students. In 2020, DCU was ranked 84th in the world in the Times Higher Education (THE) Impact Rankings which capture societal impact based on success in delivering the United Nations' Sustainable Development Goals (SDGs). DCU is consistently ranked by THE in the top 100 young universities and was named as Ireland's 2021 "University of the Year."

While DCU is a dual-mode university, it has 40 years of experience in the provision of distance education. In 1982, the National Distance Education Centre was established at DCU to provide higher education to adults all over Ireland (MacKeogh, 2003). The National Centre became "Oscail – DCU Online Education"

in 2004 to reflect the University's early leadership in new models of online delivery. The term "Oscail" translates to "open learning" in the Irish language. Since its inception, DCU has demonstrated a strong commitment to widening access to university education. Thousands of adult learners have obtained their qualifications through DCU's online distance education courses.

Over the past 20 years, DCU has developed significant expertise in the design of high-quality online education. It is widely recognized in Europe as a leader in the area and is Ireland's only member of the European Association of Distance Teaching Universities (EADTU). DCU's leadership is further evidenced by its active role in the International Council for Open and Distance Education (ICDE) and, notably in 2019, hosted the World Conference on Online Learning. DCU is also a foundation member of the European Consortium of Innovative Universities (ECIU). A strategic partnership with Arizona State University (ASU) in the United States is another powerful innovation accelerator.

---

## Strategically Embedding Digital Learning

DCU's Strategic Plan, *Talent, Discovery, Transformation 2017–2022* (DCU, 2017) was launched in September 2017. Notably, the development of the Strategic Plan included a fully online brainstorming and open public consultation event known as DCU Fuse (Brown, 2017). Over a 24-hour period, coinciding with Open Education Week, in March 2017, almost 7,000 contributions were posted by staff, students, and the wider DCU community in a customized open-source platform. The DCU Fuse conversation in which the author played a leading role trended as No 1 in Ireland on Twitter for much of this period. DCU Fuse was a significant initiative to support critical questions, provide a forum for alternative viewpoints, and promote a culture of openness, accountability, and shared ownership. Also, the initiative advanced digital ways of working and learning as an organization and the power of the network. DCU Fuse is tangible evidence of embracing debate, criticality, and open decision-making along with "walking the talk" of digitalization.

The Strategic Plan reiterated a strong commitment to harnessing the potential of new digital models of higher education. Importantly, it sought to infuse digital transformation throughout DCU's policy architecture rather than develop a separate stand-alone plan. The intention was to embed digital learning as the "new normal" at DCU and thereby avoid the risk of a "bolt-on" approach. Key actions to achieve this goal included establishing the National Institute for Digital Learning (NIDL) and the appointment of Ireland's first Chair and Professor of Digital Learning.

---

## The NIDL as an Innovation Incubator

In November 2013, the Minister of Education officially launched the NIDL with a remit to "support pioneering, technology enhanced learning and revolutionise the learning experience both for Campus-based Education and Distance Education" (DCU, 2012). Institutionally, the NIDL was seen as a key enabler of DCU's

transformative mission. It established a vision to be recognized as a world leader at the forefront and leading edge of new **B**lended, **O**n-Line, and **D**igital (BOLD) models of education. More specifically, its mission is to design, implement, and research new BOLD approaches to teaching, learning, and assessment which help to transform lives and societies.

While the NIDL team consists of several internal service units, its strong external focus helps to foster a growth mindset. Active engagement in European funded projects and a wider community of learning innovation allows new and emerging digital technologies to be piloted and tested locally and mainstreamed within DCU. The NIDL's underlying ethos is that new knowledge exists in the network. No university can afford to be an isolated island if it wishes to foster a rich transformative learning culture. Accordingly, it is no accident that since its inception, several members of the NIDL team now serve on the executive committees of many leading professional bodies. This has been a deliberate strategy consistent with the above touchstones to support leadership development and influence what questions are being asked about digital education.

As further evidence of its commitment to a growth mindset, since 2014, the NIDL team has produced over 1,000 scholarly outputs and key staff play active roles on the editorial boards of leading journals. As a strategic editorial partner of the *International Journal of Educational Technology in Higher Education*, published by Springer, the NIDL walks the talk of being at the forefront of the literature and makes a significant contribution to the research and professional community. Notably, this Q1 journal is now the number one ranked open access publication in the field and has quickly risen in rankings to 6th place (out of a total of 1,531) in the Scopus list of all education journals.

To further support its growth mindset and thought leadership, the NIDL has a high profile International Advisory Board. This Board, coupled with a full professor leading new developments, helps to keep DCU at the leading-edge of digital learning. In response to the first COVID wave, for example, in March 2020, NIDL team members launched a free online course on Teaching Online as part of the externally funded #OpenTeach project (Farrell, Brunton, & Costello, 2020). The course attracted nearly 500 participants. It demonstrates the type of agency and distributed leadership that has grown over time in the NIDL as the author was not centrally involved in this initiative. However, a willingness to lead with the head and the heart in the face of a crisis and help shape the stories being told is evident in the NIDL's wider contribution to the rapid design of *Learning How to Teach Online* offered through the FutureLearn platform (Brown, Nic Giolla Mhichil, & Costello 2021). By the time this course began in early April 2020, over 30,000 educators from more than 130 countries had registered, with this figure quickly increasing to over 90,000 by December 2020. A further example of walking the talk was the NIDL's rapid design, in September 2020, of a FutureLearn course to help promote student readiness for online learning (Beirne, Nic Giolla Mhichil, & Brown, 2021). Notably, this free course, *A Digital Edge: Essentials for the Online Learner*, was cofacilitated by students. By the time of its third facilitated offering in September 2021, the course had attracted more than 10,000 learners.

In summary, the NIDL has made significant progress in realizing its vision to be recognized as a world leader in digital education. Building on the principles of multifocal, distributed leadership, and the belief that the function of leadership is to develop more leaders, not more followers, the NIDL team has developed its collective capacity and relational capital by intentionally engaging in a wide range of professional networks. Both individually and collectively, the team has moved from being consumers of research to producers, asking critical questions with a growing collection of scholarly contributions. Moreover, through externally funded projects, the NIDL has become an innovation incubator at the forefront of research, thought leadership, and innovative practice in fostering a high performing digital education ecosystem. While the appointment of a senior institutional leader was an important catalyst to these activities, they arise through the efforts of a diverse team.

---

## Shaping the Discourse

A key aspect of multifocal leadership is understanding the power of language. This aspect of the NIDL's leadership is evident in two internal examples.

First, in 2014, *DCU Connected* was launched under the author's leadership as a major new initiative to promote the University's fully online courses. Importantly, the term "connected" was deliberately chosen to shift the focus away from a particular mode of delivery to the transformative nature of the online learning experience. The intention was to encapsulate how in today's digital world learners can be *connected* wherever they study. Distance should not be a barrier to learning as class can come to the learner, thus enabling DCU to widen its outreach. The "connected" metaphor was also intended to avoid the type of deficit language that became part of the COVID discourse around emergency remote teaching. Thus, being connected to fellow students and excellent teachers, wherever students choose to live, is at the heart of DCU Connected.

DCU's 2018 Institutional Review included the following commendation:

"The Team commends the operation of DCU Connected, its strategic and dynamic approach, and its alignment with the Institutional Mission in terms of opening access and delivering online learning" (Quality and Qualifications Ireland, 2019, p. 34).

The second example relates to DCU's virtual learning environment (VLE), a core feature of the digital architecture. In 2014, DCU launched *Loop* as an overarching "term" to promote the goal of developing a twenty-first-century digital campus. The term "Loop" was intentionally chosen under the NIDL's leadership as a metaphor to help move the thinking away from a techno-centric focus on Moodle. Loop was chosen as a term to place greater emphasis on bringing people together through technology to create a loop of learners and rich digital learning communities. The aim was to put people and learning at the core of the "loop" rather than technology. The loop metaphor also served to illustrate the idea of a rich digital learning ecology, with a variety of different tools in the loop rather than just Moodle at the core. While

at the risk of overtheorizing loop, the metaphor was intended to support an innovation culture where staff and students were encouraged to push boundaries by using new *edge* technologies to help transform the learning experience.

Loop is now deeply embedded in DCU and is also at the heart of the DCU connected learning experience. DCU has continued to add enhancements to Loop on a regular basis and is widely recognized as a global leader in the Moodle community, having hosted the annual “Ireland UK Moodle Moot” on three occasions. This is further evidence of how being in the network is part of the NIDL’s ethos. Additionally, DCU has made a significant investment in the Mahara open-source ePortfolio platform. Known as Loop Reflect, the platform is routinely used by over 14,000 students. DCU is now a leader in the Mahara community, which illustrates how the NIDL’s leadership through the work of many different people extends to shaping the international discourse. The key point is that internal transformations are supported by actively engaging in these external communities.

---

## Leveraging Strategic Partnerships

The role of strategic partnerships is another key feature of DCU’s efforts to promote digitalization and build a transformative culture. Consistent with the characteristics of multifocal leadership, strategic partnerships have acted as a catalyst for DCU to progress internal transformation. Two strategic partnerships continue to be particularly influential.

First, the decision to invest in MOOCs, and specifically Futurelearn, was not taken lightly. It followed a lengthy process of asking critical questions and identifying the key institutional drivers (Brown, Costello, Donlon, & Nic Giolla Mhichil, 2015). The overriding consideration at the time was to what extent could an MOOC agenda help to advance DCU’s commitment to a strong culture of innovation and the goal of a transformative learning experience. Thus, the primary driver was to use MOOCs to support a step change that DCU was aiming to achieve through the NIDL by increasing capability in new digital pedagogies. Consistent with the value of networks, considerable weight was placed on the potential collaborative opportunities arising from joining a global consortium. Since the launch of Irish 101 in 2018, over 140,00 learners from more than 135 countries have taken one of DCU’s Irish language and culture courses. While MOOCs continue to polarize the education community, there is no doubt that the FutureLearn strategic partnership has helped to mature DCU’s understanding of learning design for online as well as blended delivery.

The second strategic partnership is ECIU University. In 2019, DCU was successful as a member of the ECIU in securing €7 m under the new European University Initiative. Each of the 12 partner universities has a proven track record of innovation, and the ECIU University’s vision is to develop smart new transformative learning pathways. To this end, ECIU University has already developed a suite of online micromodules across the partners where students can collaborate to address major societal challenges. On completion of assessment and proof of learning, some of these short courses will earn verified ECIU microcredentials. While the field of microcredentials is rapidly growing, the NIDL’s leading role in both critique (Brown

& Nic Giolla Mhichil, 2021) and shaping new developments in this area (Brown, Nic Giolla Mhichil, Mac Lochlainn, Pirkkalainen, & Wessels, 2021) is uniquely positioning DCU to transform its traditional credential ecology.

---

## Toward a Culture of Continuous Improvement

The above examples demonstrate DCU's strong appetite for learning transformation. However, the future often lives in the past, and so an important aspect of multifocal leadership in a learning organization is critical self-reflection. To this end, in 2020, DCU undertook a comprehensive review of digital learning framed around the following questions:

- To what extent are DCU delivering on their strategic intent in relation to digital learning, as envisaged in the 2012–2017 and 2017–2022 strategies?
- How is (and how can) digital learning contributing to transforming both formal and informal learning at DCU?
- To what extent are DCU staff and students prepared to embrace digital approaches to learning, and to what extent are these approaches effective as part of the DCU learning experience?
- How is DCU's approach to supporting and developing digital learning aligned to national and international best practice and research?
- What aspirations should the University have for digital learning over the next 5 years?

Notably, in Europe only 12% of institutions report they have engaged in critical self-assessment in digital higher education (Gaebel, Zhang, Stoeber, & Morrisroe, 2021). The self-assessment exercise was shaped by the NIDL's leadership in contributing to the Digi-HE project and, more specifically, a critical review of 20 different tools for self-assessing the development of a high performing digital education ecosystem (Volungevičienė Brown, Greenspon, Gaebel, & Morrisroe, 2021). The internal self-assessment process culminated in an external review panel visiting DCU and producing their own independent report, which concluded:

The extent to which DCU has built and developed digital learning partnerships in an internal, national and international landscape is commendable. The learning associated with these practices is evident right across the organisation and will prepare the university well for the next wave of digital learning development and strategies. (Peer Review Group, 2021, p. 5)

---

## Conclusion

This chapter began by exploring the false binaries, muddied waters, and competing images of the future. The lesson for leading in changing times is that digital education needs to be better understood as part of a wider social practice and transformative change agenda. In the second part, the importance of multifocal

leadership with a wide-angle lens and the ability to zoom in and out was illustrated by drawing on the literature as well as several personal touchstones and critical framing questions. Steering a path through many complexities, inter-dependencies, and underlying tensions without losing sight of the end destination is a key multifocal leadership quality emerging from this discussion. The final part offers a glimpse into how one university with a tradition of expanding access to higher education is responding to the new digitally connected world. Although the story is filtered and potentially distorted by the author's own lens, it illustrates how the notion of multifocal leadership has been influential in a range of digital learning innovations.

It would be naïve to claim that DCU has all the answers. However, many of the touchstones of multifocal leadership and the NIDL's wider remit have been crucial to helping DCU deliver on its transformative mission. This point returns us to the central thesis. A transformative change agenda where digital education is at the heart of the institutional mission is enabled by educational leaders capable of zooming in and out and untangling competing futures. It requires criticality, a strong sense of agency, and the ability to forge strategic alliances and relationships with many different people. A related point is that leaders must be prepared to invite difficult questions and have the courage to walk the talk of learning transformation with their colleagues as it does not happen by leaving institutional plans in the boardroom.

## Abstract

This chapter considers some of the challenges of the development of strategy, both for the conventional and ODDE sectors of higher education, with a brief look at the literature since strategic planning was first in vogue in the private

sector in the early 1960s. Although the most common approach in higher education, so much so-called strategic planning does little to advance long-term visions and strategies or to differentiate one institution from another. The sudden pivot to online learning and other distance education that the COVID-19 pandemic has forced on conventional (contact) institutions has blurred distinctions between traditional and ODDE universities, thus rendering effective strategy development and implementation more important than ever.

This chapter conducts the literature review considering both institutional and system-wide strategy development, underlining their common elements. Then, from the unique vantage point of the South African Institute of Distance Education (*Saide*), a nongovernmental organization based in Johannesburg but conducting projects throughout South Africa and sub-Saharan Africa, it discusses the challenges for ODDE strategy development in the particular context of COVID-19. The chapter concludes with implications from the analysis for both the conventional and ODDE sectors in higher education in South Africa and elsewhere based, in part, on the lessons learned during the pandemic.

**Introduction**

What makes God laugh? . . . People planning!

At no time in recent memory has this old adage seemed so appropriate. The COVID-19 pandemic has been a roller-coaster ride for governments and educational institutions the world over as they struggle to cope, alternatively declaring specific policies and then being forced to renege or change them in the face of viral mutations and unpredictable human behavior. Any expectations that the peoples of the world would be drawn together by a universal challenge touching everyone have been dashed by conflicting responses, regional chauvinism, and exacerbated political divides about the most appropriate responses to the pandemic.

Under such conditions, one might expect strategic planning, the vaunted approach to corporate leadership in past decades, to be more necessary than ever. However, the notion of dramatically changing times is hardly a new concept. Mintzberg (2014) has shown how leaders in every decade have justified the need for strategic planning because of times of major transformation even though the golden era of strategic planning (1960–1980) was a period of unprecedented stability. But 2021 is clearly a time of unprecedented change and challenge given the threats and instability brought on by the chronic and parallel crises of the pandemic, climate change, and racism, all of which have brought new considerations and increased complexity to institutional and political leadership.

## Strategic Planning and Strategic Positioning

Mintzberg's influential writings about the shortcomings of strategic planning have led to reconsideration of its value but, if somewhat altered, it remains a key management tool for organizational and system effectiveness. For example, when someone is appointed as the president of a university or college, he or she usually resorts very quickly to launching a strategic planning process. The standard approach is to consult widely at the outset, both internally and externally, to seek to understand the special circumstances of the institution through some sort of SWOT (strengths, weaknesses, opportunities, and threats) analysis and, hence, to propose a new strategic plan to guide the institution for the years to come. The heart of such a plan is a vision that defines an institution's *raison d'être* and differentiates it from the competition.

Such approaches are often very effective but they can also be misguided, time consuming, and ultimately unhelpful to the institution's development. Mintzberg (1994, p. 1) asserts that strategic planning is not strategic thinking:

Indeed, strategic planning often spoils strategic thinking, causing managers to confuse real vision with the manipulation of numbers. And this confusion lies at the heart of the issue: the most successful strategies are visions, not plans.

Mintzberg's work has recognized that a narrow, structured planning process may be too much about administrative control and fail to recognize the importance of strategic thinking and individual responses to institutional plans. This seems particularly relevant to universities where leaders have less prescribed authority and where faculty processes are often cumbersome and resistant to change.

Eckel and Trower (2019) echo Mintzberg's work.

Too many university strategic plans are mostly outcomes or ideals (or unfunded "wish lists"), without an articulation of strategy. (p. 1)

... strategy is not planning. A focus on strategy is intended to help institutions experiment and take initiative, to ask questions and create synergies, and to move institutions ahead in often unknown and unknowable environments. (p. 4)

Effective strategic planning is not easy. Roger Martin (2014) suggests that many executives pursue it because it is comfortable when the challenges of forging strategic directions are anything but predictable. Like Alex Usher (2019) and Eckel and Trower (2019), he also challenges the tendency to forge five-year strategic plans when effective strategy should be much longer term in its reach – at least 15 years.

Any scrutiny of strategic plans from comparable postsecondary institutions will usually find they are very similar. Martin emphasizes that plans can hardly be considered strategic if they are indistinguishable from each other, given that a key purpose of strategy is to gain institutional advantage. Eckel and Trower (2019) mock this tendency, noting the frequency of such general objectives as "performing high

tech research” or providing all students with “a transformational learning experience” by wondering what the alternatives are – “low tech research?” or “providing a less than transformative learning experience for all students?”

According to Ikenberry, strategic planning must not be confused with tactics. He believes that university leaders “are too often seduced by short-term tactical questions. . . that tend to crowd out the major strategic questions that will ultimately be more critical to the organization’s future” (Ikenberry, 2006, p. x).

Tactics were particularly evident in many institutions confronted with the onset of COVID-19 when there was little time for strategy and institutional leaders had to scramble to replace conventional teaching and learning with online delivery of programs with little time to prepare faculty, staff, and students for the changes. This pivoting for institutional survival contrasts starkly with Ikenberry’s notion of strategic leadership, which “is about long-term positioning, the successful execution of a multiyear strategy. . . It seeks to reposition the institution in new and fresh ways with stakeholders, it seeks differentiation not homogenization and it seeks to thrive, not just to survive” (Ikenberry, 2006, p. xi).

Notwithstanding such well-documented concerns, there is almost no university website that does not feature an updated strategic plan. This usually includes a mission statement and a series of initiatives designed to achieve its goals together with accompanying operational plans and accountability mechanisms such as benchmarks and time lines. While primarily instruments for internal decision-making, strategic plans can also be valuable marketing materials which is why they are so prominent on university websites. For example, the UKOU’s one-page summary of its current strategic plans (*The Open University*, 2021) lends itself readily to institutional promotion. This propensity to use strategic plans for marketing and promotion underscores a key difference between private and public sector approaches – private companies seldom publicize their strategic plans so as not to reveal their strategies to the competition.

Concise strategy documents are not the norm, however. The nature of decision-making in a university is particularly challenging for effective strategic planning. There are huge pressures to incorporate objectives from a great range of stakeholders, from faculty and students to governments, funding agencies, and employers. Internal decision-making processes tend to be slow and cumbersome and, too often, the result is a plan that tries to be all things to all people which is thus not really a plan at all.

Even where an institution’s strategic plan effectively projects a long-term vision and ambitious objectives for its realization, the work has only just begun. Too many such documents gather dust on president’s shelves until the next planning exercise is initiated, often by the incumbent’s successor. Falkenburg and Cannon (2020) have explored the whole process systematically and, like Piper and Samarasekera (2021) and earlier research by Westley and Mintzberg (1989), they emphasize the intuitive and the inherent weaving of strategic planning and organizational culture through engaged consultation to facilitate responsiveness rather than complacency. So, while the most common term in higher education in this domain is “strategic planning,”

our primary interest is in strategic positioning and strategic management as ultimate tests of how effective any planning exercise is, in our institutions and in government.

## **The Context: The Pandemic and Strategy Development in Higher Education**

Bargh, Boccock, Scott, and Smith (2000, p. 24) suggest that when the organizational context is “divergent” (goals and structures are increasingly inappropriate to the prevailing environment), the leader should challenge the status quo. One could argue that the onset of COVID-19 has rendered most organizational contexts “divergent” which would suggest that strategy development, thinking, and management are more important, and perhaps more difficult, than ever.

The pandemic has challenged the very nature of planning by forcing institutions and their leaders to “pivot” frequently to cope with the latest crisis. This is echoed in the public service generally as government leaders struggle to find the appropriate policies and practices in the face of such an elusive and constantly changing threat. The evidence is pretty clear that vision and leadership are particularly challenged in such a disruptive era where today’s popular decision may be very unpopular a few months later as a new virus strain upsets all the assumptions of the earlier position.

At a time when the majority of the population is looking to government(s) for leadership, a roller coaster of stop-go decisions has contributed to an undermining of public confidence in their leaders. Political leaders the world over have diverged considerably in the ways they have responded to the pandemic, with some being cautious and quite strict with others seemingly in denial that anything serious has been going on. The ensuing distrust of leadership has implications for institutional leaders as well.

For a college or university president, the most important challenge for strategy development is to build consensus around strategic priorities, a clear understanding of the reasons for them and why they are critical to institutional success. And, once strategies have been adopted, it is vitally important that they guide implementation and decision-making and that they are constantly reviewed on the basis of their impact, both positive and negative.

University leaders do not have the same powers and authorities of their private sector counterparts and it will not be enough to simply proclaim a new strategy. Once one is adopted, the real work begins. Credibility and trust can be built with an effective plan but cynicism and apathy will quickly take over if the plans are ineffective in achieving the higher-level goals held out for them in the first place.

Writing in the British context, Bargh et al. saw vice-chancellors’ preoccupations with strategic planning as evidence of their struggles with the pressures of change and tradition.

Mass higher education poses intellectual as much as managerial and organizational challenges, and so far the university world remains racked with ambivalence about its future(s).

In that sense strategic planning can be seen as part of a debate about the core values which underpin higher education. (Bargh et al., 2000, p. 24)

This demonstrates that uncertainty about the roles of and priorities for universities were among the significant issues before the onset of COVID-19 but the latter has almost certainly further eroded trust in leadership and rendered the jobs of presidents and vice-chancellors even more difficult.

## Strategy Development in Government

Most of the literature on strategy development pertains to individual institutions, but the same principles and concerns apply to those overseeing whole systems of higher education, as we will show in the following case study of South Africa. Boland, Thomas, and Werfel (2021) are strong advocates for strategic planning in government as a prerequisite to dealing with the huge challenges faced in every country, notably in the face of four key and difficult realities:

- (a) The scale and pace of change, including changes driven by advancing technology.
- (b) The involvement of more stakeholders than in the past (magnified by COVID-19).
- (c) An ongoing erosion of public confidence in leaders.
- (d) Squeezes on discretionary spending due to rising deficits, aging populations, and the increasing cost of government services.

Hence, the same caveats for successful strategy development apply to government leaders as to the heads of colleges and universities. Ultimately, the success of such planning will depend on the public's trust and confidence in government and institutional leaders alike.

## The Particular Demands for ODDE Institutions

If this chapter had been written before the onset of COVID-19, it would have been limited to institutions in the ODDE sector. However, the dramatic need for most conventional colleges and universities to pivot to online learning without much time to prepare or consider the consequences has brought unexpected attention to ODDE. There has not been time, nor indeed the inclination, for conventional institutional leaders to try and learn from the experiences of the ODDE sector. Instead, they have been thrown into an unfamiliar scenario and had to learn quickly from the failures and successes of sudden moves to online learning.

The initial shock in scrambling to replace face-to-face learning in 2020 has been mitigated to some degree by better planning and more professional development in

2021 and by the adoption of blended and hybrid schemes that try to find the best of both worlds. These changes have dramatically increased the profile of ODDE, but because the changes were brought in without time to plan very much, they have also generated considerable negative publicity about online learning dissatisfaction regarding the learning experience in traditional institutions not familiar with the attention given to course design and student support in dedicated ODDE institutions.

The pandemic may have dramatically increased the challenges facing conventional colleges and universities but pressures for change in postsecondary education were already there. The explosive rise of new communications technologies has increasingly challenged the sector to be more nimble and able to pivot quickly to take advantage of opportunities, and there has been more and more acknowledgment of the need for change independent of the pandemic.

In this context, strategy development and planning is central to an institution's (or a government's) ability to respond. Its components are the following:

1. A clear and differentiating vision for the institution's development.
2. Acceptance and articulation of this vision within the institution, a particular challenge in one as diverse and complex as a university.
3. Widespread communication of this vision, both internally and externally.
4. Operational plans designed to realize the vision over the long term.
5. Accountability mechanisms that measure the extent to which the operational plans have been successfully implemented.
6. Regular revisits to strategic choices to ensure that they are still right for the institution and have widespread internal and external support.

In this connection, a 2011 publication from Ontario's *Contact North/Nord* offers a practical template for strategic planning for online learning by the province's institutional leaders. It guides the reader through an exemplary strategic planning process, starting with two fundamental questions that recognize the importance of institutional vision and differentiation.

Does the institution have a clear, owned and widely understood vision for online learning?  
Can key leaders describe what it will be doing differently in terms of teaching and learning  
5 years from now? (*Contact North*, 2011, p. 2)

This represents, then, an effective approach to strategic planning that underlines the vital importance of strategy and emphasizes the importance of differentiation for a given institution.

These issues are now explored through the particular case study of ODDE in South Africa and the key strategic role played by the South African Institute of Distance Education (*Saide*). This selection is based both on the importance of exploring the issues in a developing country with the added benefit of an institution dedicated to facilitating it.

## Strategic Planning for ODDE in South Africa

### University Education System in South Africa (SA)

SA's new democracy in 1994 heralded a dramatic departure from a racially divided university system (with the bulk of universities serving largely the minority White community with separate universities for Black African students in designated "homeland" areas and one university each for so-called "Colored" and "Indian" students) to an integrated system dedicated to the social justice values and principles of the new democracy, committed to promoting equity of access and fair chances of success while advancing redress for past inequalities.

The new system, framed by a white paper (Ministry/Department of Education, 1997), provided for a large amount of public university autonomy under the notion of cooperative governance, with the (now) Department of Higher Education and Training (DHET), the Council on Higher Education (CHE), and its Higher Education Quality Committee (HEQC) steering the system through:

- Enrolment planning – includes the mix (level and subject area) of programs on offer, enrolment numbers, and mode of provision.
- Funding to be expected from government as subsidy as well as ear-marked funding.
- Quality assurance mechanisms overseen by the CHE and HEQC, including institutional audits, new program accreditation, and program reviews for the first two decades. A recent CHE document places emphasis on standards development, promotion and capacity development, and a move away from program to qualifications accreditation (CHE, 2021).

All public institutions are subject to the "steering" outlined above. They are required to negotiate their enrolment plans with DHET in order to receive state funding, which is based on these enrolments as well as on numbers of graduates produced. Private institutions are subject to separate registration but the same quality assurance processes.

The latest *White Paper for Post-School Education and Training* (2014a) saw the development of policy for an integrated post-school system that would:

- Assist in building a fair, equitable, nonracial, nonsexist, and democratic South Africa.
- Expand access, improve quality, and increase diversity of provision.
- Build a stronger and more cooperative relationship between education and training institutions and the workplace.
- Be responsive to the needs of individual citizens, public and private sector employers as well as to broader societal and developmental objectives.

## The Special Role of *Saide*

Established as a small nonprofit independent organization, governed by a board of trustees, in 1992, *Saide* is guided by a vision of a society in which all people value, have access to, and succeed in lifelong education appropriate to the global knowledge economy. Its mission is to increase equitable and meaningful access to knowledge, skills, and learning through the adoption of open learning principles and distance education methods. *Saide* acts as an advocate, catalyst, and facilitator of change in education policy and practices. Over the years, *Saide* has contributed to a range of educational policy processes, supported a number of systemic interventions, and worked with educational practitioners to transform their practices. While initiated in South Africa, the organization has increased expanding its services to many countries in sub-Saharan Africa. *Saide* has been particularly active in the South African university sector, contributing to country-wide processes and engaging with individual institutions.

## COVID-19 in South Africa

COVID-19 has changed much of our lives including the modes of provision in higher education, particularly for those at residential universities. While faculty and students have enjoyed some respite from daily commuting, taken-for-granted classroom practices in face-to-face teaching environments have been shown to be replaceable with faculty forced to attempt new online practices.

COVID-19 has had dramatic effects on context, with students and staff from traditional institutions coming to accept the possibility of the education process moving away from the classroom to educational practices making use of technology in a variety of ways. It has underscored the importance of understanding who your students are and the context in which they study. It has also exacerbated inequality within and between countries. Rich countries are recovering far more quickly than middle-income and poor ones. The upper middle classes are least affected and employment rates among men recover more quickly than those of women.

COVID-19 has aggravated an already challenged higher education sector. The cost of higher education has increased far more than inflation in many countries, with the cost per student place becoming increasing unaffordable for many countries and students. For example, South Africa cannot afford to fund its target enrolment rate of 1.62 million students by 2030, set in 2012. This was to be a modest 25% of 18- to 25-year-olds up from 17.3% in 2011 (DHET, 2014a, p. 30). Already staff-student ratios have deteriorated, resulting in class sizes growing dramatically in some faculties. All of this has transpired in a context where the growth of higher education is essential for a world of work increasingly dependent upon digitization and artificial intelligence.

## Learning from the COVID Experience

These changes impact on strategy for the university sector. Strategy development involves consideration of context, clarity of values, and forging a position in order to determine a plan of action that involves strategic choices. In particular, the COVID experience is likely to erode the taken-for-granted niches of distance education institutions. In this context, it both underlines the need for a complete rethinking of ODDE and serious considerations of new opportunities that are identified in the process.

## Role of ODDE in the University Sector

Traditionally, across the world, distance education has been seen as providing an opportunity for those unable to access traditional universities. In 2004, a special report on distance education (CHE, 2004, pp. 17) outlined this positioning by identifying the key motivating factor for distance education as providing “access to students for whom – either because of work commitments, personal social circumstances, geographical distribution, or poor quality or inadequate prior learning experiences – traditional full-time contact educational opportunities are inappropriate or inaccessible.”

Experiences of remote emergency teaching under COVID-19 have encouraged traditional universities to venture beyond their practices of offering contact opportunities which “require students to attend classes regularly at set times in order to discover the curriculum” (reference?). This has enlarged the pool of students constituting their target market. Traditional universities can potentially play a far greater role in meeting the needs of the post-school system as described in the 2014 White Paper:

...for the post-school system to cater for a very wide variety of potential student needs, including mature adult learners who have to study and work at the same time, as well as younger people who may have dropped out of the schooling system due to financial, social, learning or other barriers. Such students require access not only to a diverse range of programmes, but also to appropriate modes of provision which take into account their varying life and work contexts, rather than requiring them to attend daily classes at fixed times and at central venues. (DHET, 2014a, p. 48)

## The Iron Triangle

The abovementioned CHE (2004) report goes on to suggest that the South Africa’s resource-constrained system should also capitalize on the potential of distance education to achieve economies of scale while not compromising quality. Daniel’s “iron triangle” as the basis of an effective distance education institution requires an appropriate balance across access, cost, and quality (Daniel, 2009).

Immediately post-1994 in SA, the pursuit of access was considered paramount, with a goal of “massification” particularly for previously marginalized groups, both for the system as a whole and for distance education. The system almost doubled in size from 490 to 837 thousand students over the period 1994–2009, but, importantly, the number of African students in the system increased from 32% in 1994 to 66% in 2009 (National Planning Commission, 2014, p. 317) and to 77% in 2019. (CHE, 2021a, p. 3). This compares very favorably with the percentage of Africans in the population (81%). In 2019, 60% of headcount enrolments were of women compared to their share of 51% of the population (CHE, 2021a, p. 5).

In 2001, distance education students made up 43% of headcount enrolments and, because they were largely part-time, 29% of full-time equivalent students (DoE, 2001, pp. 36, 44). However, by 2014, this percentage of headcount enrolments had decreased to 38% and to 34.5% by 2019 (CHE, 2019, p. 9). This decline is explored below. Of those in distance education, 80% were African and 69% women, showing how distance education has made a particularly important contribution to access. Unfortunately, it appears that access for older students (over 35) has steadily declined in recent years with only 24% of distance students being older than 35 (CHE, 2019, p. 11) compared to 32% in 2011 (CHE, 2018, p. 11). In general, however, distance education has a proud history of offering **access** to more marginalized students.

This provision is also substantially more “cost-efficient” than that of the conventional institutional provision, with government subsidies per full-time equivalent student enrolment in distance education being half that of the subsidy for face-to-face provision (DHET, 2014b). Student fees are generally far lower, with the cost of a three-year qualification through distance being roughly half that of conventional provision.

This aspect is particularly important in South Africa in planning a post-COVID future. The aspiration of equitable access to university education has led to over 60% of South Africa’s students being supported by the National Student Aid Fund (NSFAS), which covers tuition fees and living allowances, with much of the remainder of university costs coming from government subsidy. The level of these subsidies is also under attack as COVID-19, among other factors, has wrought havoc on the budget allocated to higher education, with university infrastructure grants already curtailed.

The higher education system is therefore under huge financial pressure – more cost-effective ways of provision need to be found. In positioning themselves in a post-COVID era, it is therefore imperative that the system and individual institutions respond to the extremely serious challenge of the increasingly unaffordable nature of the current teaching and learning model of the university sector.

Unfortunately, the third side of the iron triangle – quality – is questionable in much distance provision. This is exemplified by a measure of one central component of “quality” – student success. Already in 1995, *Saide* had raised an alarm bell that the pursuit of improving access in distance education needed to be accompanied by equal emphasis on student success, showing that only 15% (Arts), 10% (Commerce),

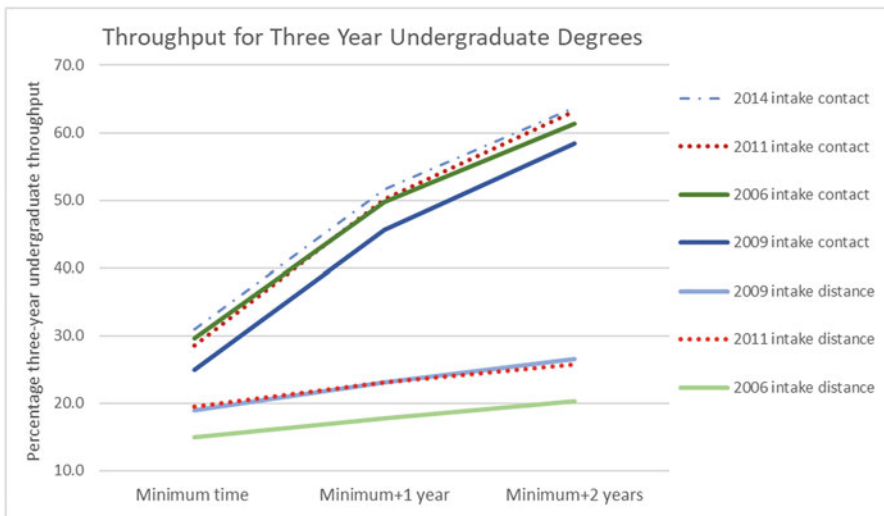

and 6% (Science) of students who were enrolled past the census date completed their degrees in 9 or 10 years for a three-year qualification (Saide, 1995, p. 5). This was largely ignored by governments and institutions for over 15 years.

More recently, issues of student success have come to the fore. Over the last 10 years in particular, especially as it became clear that there were not enough resources to further expand the system, DHET identified the serious impact of students taking too long to complete with too few ever completing. With the national data available via a new (1998) Higher Education Management Information System (HEMIS), it was possible to track student retention and course/module success rates, as well as conduct cohort analyses which showed student throughput rates within minimum time (M), minimum time plus 1 (M + 1), and minimum time plus 2 (M + 2). Minimum time for a three-year qualification for a distance student is considered to be 6 years.

Figure 1 below shows the dramatic differences between the throughput for three-year degrees through “contact” mode of provision and that of distance provision (DHET, 2020a, pp. 25–28).

They also show the marked improvement in throughput for distance education from the 2006 intake to the 2011 intake. Of the 2006 intake in distance education, 15% completed in six years, 17.7% in seven years, and 20.3% in eight years. (This percentage rose to 24.9% after 10 years.) Of the 2011 intake, 19.5% completed in six years, 23.1% in seven years, and 25.7% in eight years.

The pattern for three-year diploma throughput is very similar. The improvement seen is a result, at least in part, of some deliberate efforts within the dedicated distance education institutions (which make up more than 80% of distance education

**Fig. 1** Throughput for three-year undergraduate degrees across contact and distance provision

provision) to improve their quality of support. The notion that distance education must provide both access and success is now firmly entrenched within policy.

Throughput rates are, however, not the only measure of student success. It is suggested below that open learning principles are a useful high-level lens through which to begin to examine the quality of provision, especially for distance education.

## Open Learning Principles

In reimagining university teaching and learning, it is critical to be guided by broad goals for the sector rather than being distracted by the new technological tools it has learnt to use. As set out in the white paper of 2014, this involves careful consideration of the context in which students will study and subjecting the use of the new tools to careful scrutiny through a range of principles.

The white paper, with its vision of diverse modes of provision, sets out principles of open learning to guide implementation. These have strong underpinnings of social justice, in line with efforts to build a new equitable democratic South Africa, providing a clear set of values essential for strategy development. SA policy sees open learning as a range of principles which need to be applied to all modes of provision but particularly to distance education – these include access (widely used in distance education discourse), success, and accumulation of learning.

Open learning is an approach which combines the principles of learner centeredness, lifelong learning, flexibility of learning provision, the removal of barriers to access learning, the recognition for credit of prior learning experience, the provision of learner support, the construction of learning programmes in the expectation that learners can succeed, and the maintenance of rigorous quality assurance over the design of learning materials and support systems. (DHET, 2014a, p. 13)

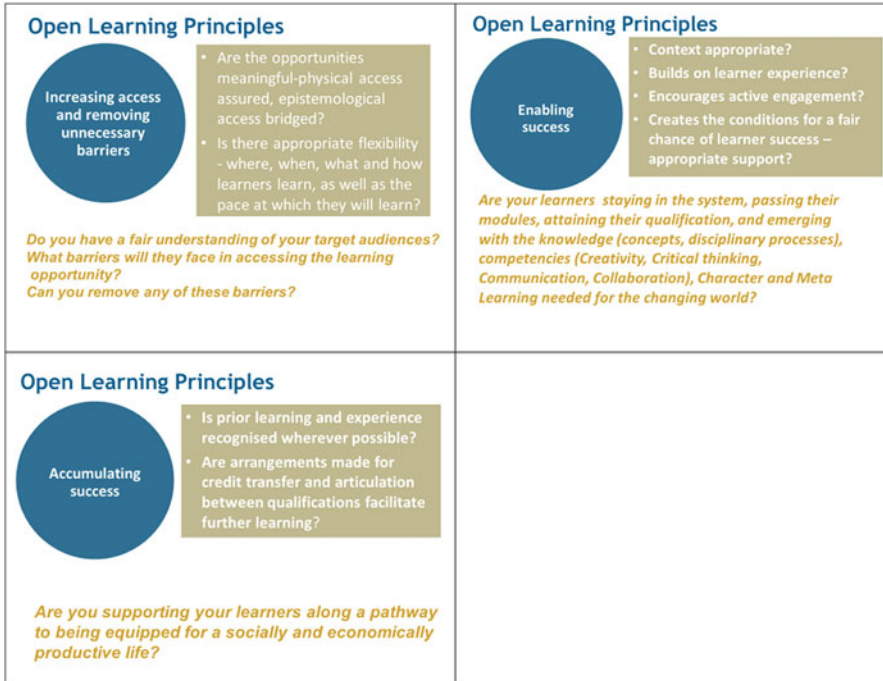

These were further elaborated at a September 2021 DHET Research Colloquium as part of a presentation by Glennie (2021) in which she challenged educators to examine their online learning provision using the open learning principles (Fig. 2).

The above framework aligns to South Africa's existing quality criteria, although they need to be interpreted according to the mode of provision. All South African higher education, regardless of mode of provision, has been subject to the same quality assurance provision.

A COVID-related quality assurance framework (CHE, 2020) cites the “humanising framework” of Stobel and Tilberg-Webb (2008, p. 11) which highlights the following core principles for teachers to integrate technologies into instructional design and education:

- Fostering independent thinking.
- Problem-based learning.
- Student-centeredness.
- Student engagement and interaction.

**Fig. 2** Open learning principles different dimensions

The main purpose of the humanizing framework is that the larger educational goal remains in focus and that the technology is only used as when and how it may be appropriate to achieve these goals (CHE, 2020, p. 17)

The values espoused echo several of the open learning principles, but anecdotal evidence points to COVID provision, especially for large classes, concentrating on the conveying of information, with large numbers of resources piled on students, little student engagement, and assessment focused on recall. Moreover, in our digitally unequal society, students often access their learning management systems through smart phones with sporadic connectivity and erratic electricity supply.

### Strategic Positioning for both ODDE and Traditional Institutions

#### Shaping the System Toward National Goals

As indicated in the introduction, it is essential for any strategic planning process to articulate a mission that distinguishes it from other universities. In South Africa, this is referred to as differentiation. In the except that follows, both achieving national goals and differentiation is encouraged.

Differentiation is a way of ensuring a diverse system that will improve access for all South Africans to various forms of educational opportunities, improve participation and success rates in all higher education programmes, and enable all institutions to find niche areas that respond to various national development needs. A differentiated system should provide a variety of modes of learning, learning programmes, and methods of teaching and assessment for diverse student bodies, and should support both flexibility and innovation. It should also allow an effective and focused way of distributing public funds, and improve the overall quality of the system. (DHET, 2014a, p. 9)

Once these clearly differentiated missions are developed, universities can move to developing their strategic goals to achieve this mission, with related activities and high-level indicators. The ensuing annual performance plans are as follows:

### **Institutional Strategies**

In determining their missions, COVID-19 has blown traditional higher education demarcation wide open and both traditional and ODDE institutions will need to reconsider their overall strategies in response. The competition for students will take place in a number of ways with ODDE institutions finding their traditional markets of remote and part-time students contested.

#### 1. Targeting remote students

Traditional universities are likely now to be confident that they can offer small enrolment courses to students wherever they are located in the country. In preparation, some universities are already considering setting up a network of learning centers which provide all the necessary facilities so that students can study away from their central campus. However, traditional universities may be wary of large enrolment course/modules where the importance of careful course design is paramount, an area where distance education is expected to excel and the organization of large-scale academic and psychosocial student support is underscored.

#### 2. Targeting part-time students

Conventional universities in large urban areas already enrol substantial numbers of part-time students within their vicinity. They may continue their fully online offerings here and feel confident to expand these part-time offerings to remote students as well. Cost may be a deciding factor. In SA, despite the major distance education institution receiving half the enrolment subsidy of traditional residential education from the state, they charge half the fees for a full qualification compared to traditional universities.

#### 3. Understanding the context and profile of students

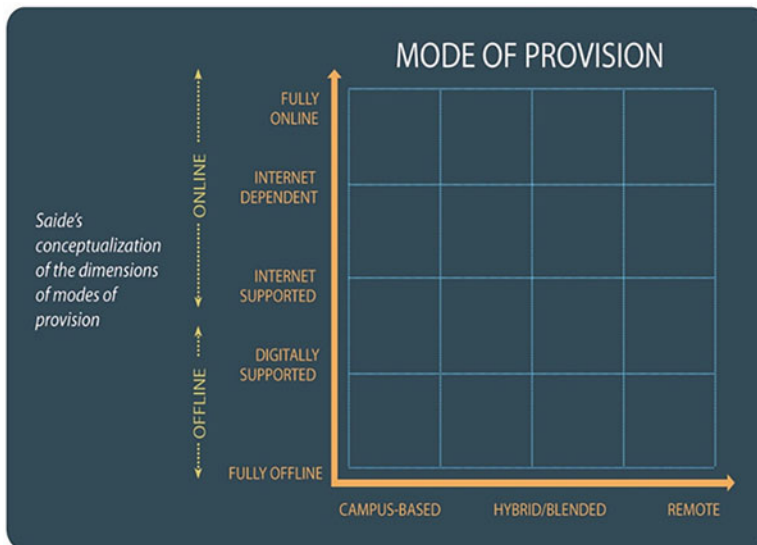

The COVID experience has underscored the importance of knowing the context of likely students to determine what mix of technology one is able to take as a given,

especially if students are not accessing the campus regularly. There are significant disparities in such crucial concerns as access to devices, uninterrupted access to the Internet (which is too often intermittent even in areas of Johannesburg, making synchronous sessions hazardous), and even issues of the constancy of the supply of electricity. Moreover, in a very large sample of South African students, more than half (54%) did not have a quiet place to study, and only half (50%) indicated that they had appropriate network connection (DHET, 2020b, p. 7).

The following grid has been useful in helping to determine where to locate the mode of provision with the accepted notion of a continuum elaborated to include a second dimension of levels of the adoption of technology (Fig. 3).

Distance education is viewed as anything on the right-hand side of the grid above – degrees of remoteness of the student – with the cutoff being the percentage of face-to-face or synchronous learning hours against the learning hours for the course/module. Defining a cutoff was necessary for funding differentiation, and ensuring that traditionally face-to-face universities did not move into serving remote students without adequate planning.

Important dimensions can be added to this grid, including axes for kinds of pedagogy, role of the educator, assessment types, and sources of feedback (Hodges et al., 2020). For this chapter, the consideration of class size is imperative. Hodges et al. suggest class size criteria of under 35, 36–99, 100–999, and over 1000. Clearly, the interactions an educator can have with a class of 35 are very different from those possible with much larger groups. It is in the latter two categories where ODDE is meant to thrive.

**Fig. 3** Dimensions of modes of provision

#### 4. Ensuring cost-effectiveness

It is apparent from the above analysis that any strategy for a distance teaching institution in the post-COVID environment must address all three legs of the iron triangle. It will be no small challenge to retain the system's accessibility via distance education while significantly improving completion rates without jeopardizing its cost advantages.

---

### **Summary: Lessons Learned for Better Strategy Development**

Effective institutional leadership starts with a strategic approach to institutional development. While the common practice of strategic planning can be an effective tool for institutional advancement, it will only be successful if it is clearly strategic – identifying a particular identity of and long-term vision for the college or university that separates it from competitors followed by comprehensive strategic and operational plans intended to achieve its primary goals.

COVID-19 has blurred the distinctions between conventional and distance teaching institutions as the former have been forced to pivot quickly into online learning and other methods of distance education. This has, in turn, raised the bar for strategic positioning of each institution.

These developments can be both positive and negative for the ODDE sector. On the one hand, distance education and digital learning have gained a new prominence and it is highly unlikely that conventional colleges and universities will revert completely to in-person classroom teaching post-pandemic. Instead, they will develop blended or hybrid approaches that reduce the distinction between conventional and traditional distance teaching institutions. And they will do so in the great majority of cases without trying to learn from the previous experiences and research of ODDE institutions. Indeed, for small classes, it may not be long before the conventional institutions, especially those with greater resources, will catch up to and even surpass ODDE institutions in their knowledge of and effectiveness with online and digital teaching.

However, for large classes, conventional universities may continue some of their existing COVID practices of simply conveying information to students through the online lecture mode with little engagement with and among students. In this case, ODDE institutions need to bring to the fore their particular talents – intensive course design, interactive purposive learning materials, and the ability to engage with large numbers of students through decentralized student support. In this case, they will be able to steal back from conventional universities. This could have a major impact on the latter as large class sizes are an important part of their financial sustainability.

As the South African experience has demonstrated, ODDE institutions have dramatically increased access to higher education but unless they are able to achieve much more competitive completion rates while retaining their cost-efficiencies, they will not be seen as cost-effective recipients for the allocation of scarce national resources. While they will benefit from the legitimization of their approaches to

teaching and learning, their response to the envisaged competition will be crucial to their future success. They will need to be very strategic in their development, capitalizing on their experience and expertise in course development and student support, always mindful of the three prongs of the iron triangle.

Overall, national and institutional leaders will have to strategize and plan for a system of institutions that contributes to national goals by meeting the iron triangle requirements and fulfilling open learning principles while always taking the context of the students into account.

While the edges may be sharper and the challenges greater for South Africa than for many wealthier nations, it is not difficult to see that the issues at stake are universal in the post-COVID era. There is no time to lose!

## Abstract

As leaders of distance education in sub-Saharan Africa were dealing with myriad challenges of high numbers of young people seeking access to higher education, lack of technologies, and inadequate expertise for online teaching, Covid-19 pandemic emerged, and, almost overnight, quick decisions had to be made to pivot to online spaces to ensure that learning occurred even in the midst of the crisis. Leaders who were flexible and adaptive to changing environment were able to respond effectively to this crisis. Hence the focus of the study is on the character of a distance education leader who is exhibiting personality traits that will enable him or her to move a distance education institution forward.

The futures triangle was used to contextualize and historicize the character of a leader who has the ability to be innovative and willing to take risks in the face of crisis. The aim of this chapter is to illustrate how some historical factors have not only influenced the leadership practices in distance education, but they have molded the characters of distance education leaders. The futures triangle mapping process revealed that the legacy of colonialism, the lack of managerial skills, the slow adoption of using technologies, the growing number of people who cannot be accommodated in higher education, and, most recently, the Covid-19

**Introduction**

Leading change in distance education has been a major challenge in most sub-Saharan African countries where there is lethargic economic growth, high unemployment rates, resource constraints and ill-health, wars and displacement of people, and governments that are incapable of providing home-grown solutions to their citizens (Odhiambo, 2014; Sawyerr, 2004; Varghese, 2013). As leaders of these institutions were dealing with all these challenges, the Covid-19 pandemic emerged and further pushed most countries to the worst health crisis ever that affected every institution in the world. Almost overnight, education ministries and academic leaders had to make quick decision to pivot to online learning. Virtually every education institution in sub-Saharan Africa struggled with this transition mainly due to the lack of the requisite information and communication technology (ICT) infrastructure, inadequate expertise for online pedagogies, and inability to provide appropriate devices to their students and staff (Wangenge-Ouma & Kupe, 2020). Transitioning to online environment requires agile systems and structures to support digitalized teaching and learning (Dumulescu & Muşiu, 2021). Leading change of this magnitude require resilient leaders who “have the ability to recover, learn from and grow stronger in the face of adversity” (Reed, 2018; p.127).

Although these changes were taking place in higher education institutions throughout the world, they were exacerbated in places of limited resources such as sub-Saharan Africa. The need for change in the higher education sector of sub-Saharan countries have been on the horizon for a long time. In fact, some of the changes were mooted shortly after independence of many countries in the 1960s. The postcolonial policies identified distance education mode of delivery as the viable option to widen participation in higher education (Makoe, 2018; Mukama, 2016). Regardless of the clear vision provided by policies, there are only six publicly funded distance education institutions in sub-Saharan Africa. For decades, the University of South Africa was the first and only higher education institution to deliver programs through distance mode. It took about 50 years before the establishment of the second open and distance education institution in Africa in the 1980s, and since then, there have been four more open and distance universities established.

Part of the reason that education policies failed in the new independent countries was that the vision, aspirational as it might be, was not aligned to the challenges of building the nations after colonial domination. Some higher education leaders lacked

capacity to translate policy issues into actions. This is because most academic leaders had limited understanding of their role as custodians of the vision of the institution (Viennet & Pont, 2017). Although leadership is critical for the success of the institution, it is during changes that leaders are expected to communicate a clear vision on how they plan to move the institution forward. The role of vision is to bring people together and give them hope and the sense of the possible (Inayatullah, 2008, 2020; Shipley & Newkirk, 1999).

The focus of this chapter is on distance education leaders who are expected to generate a powerful vector in the direction of change (Todoruț, 2017). Therefore, leadership will not be viewed in relation to the position an individual held, according Odhiambo (2014); instead, it should be seen in terms of how an individual leader respond to change in times of crisis. Unfortunately, there has been very little research in distance education leadership (Beaudoin, 2003, 2016; Marcus, 2004; Nworie, 2012). The few studies that are there tend to focus on the leadership roles and performance in managing the core functions of digitalized distance education (Beaudoin, 2016; Nworie, 2012; Weller & Anderson, 2013). Little is said about the personality traits, that is, behavioral characteristics of an individual who is expected to lead in a changing environment.

Early personality trait researchers assumed that effective leaders exhibit certain types of characteristics that make them stand out from other people (Ghaffari, Shah, Burgoyne, & Aziz, 2017). However, critics of the personality trait theory argue that effective leaders are those that are able to assess the situation and adapt their style to address a specific need (Lawton-Misra & Pretorius, 2021). Unlike the personality trait theory, the humble leadership theory focused on the characteristics of the leaders and how they relate to their subordinates (Ali, Zhang, Shah, Khan, & Shah, 2020). This theory, like servant leadership, places a lot of emphasis on the importance of relationship between the leader and the subordinates, and they view their accomplishments in relation to others. These two theories are embodied in the African principles of *Ubuntu* that requires strong community interdependence and solidarity among people. In fact, a person who exhibits these traits that are both innate and learnt is often referred to as being human (*botho*). It is therefore expected that a leader exhibits qualities that place the interest of the community above their own. Other theorists argue that leaders adapt their leadership style based on the situation they encounter (Lawton-Misra & Pretorius, 2021). What seem to be clear in all these theories and approaches is that effective leadership may be influenced by a variety of factors including personality traits, the situation in which the person operates, and the strategies that the leader employs when faced with a crisis (Fernandez & Shaw, 2020; Ghaffari et al., 2017; Lawton-Misra & Pretorius, 2021). However, this chapter will focus on what it takes to be a resilient leader in the transitioning environment.

When Romanian academic leaders were asked about their experiences of managing change during Covid-19, they pointed out that their strong proactive attitude and their risk-taking behavior helped them to navigate the choppy waters of the crisis (Dumulescu & Mușiu, 2021). It seems that the academic leaders who were effective during the crisis were those who exhibited the personality traits of resilient leaders who face problems head on and are willing “to take risks by trying out new things

and meet challenges in unconventional ways” (Mrig & Sanaghan, 2017, p.24). Resilient leaders are those who use their individual attitudes, values, and actions that enable them to overcome any hurdles on their way. They have an innate human capacity to demonstrate strength and flexibility to withstand adversity (Couto, 2002). What is needed most in the face of a rapidly changing environment is a resilient leader who “don’t just bounce back from challenges or crises; but bounce forward” (Mrig & Sanaghan, 2017, p. 24).

Institutions thrive when their leadership is enabling, honest, firm, competent, and provides a vision for the future (Ayee, 2014; Odhiambo, 2014). While leaders produce change, “effective leaders produce constructive or adaptive change to help people survive and grow” (Ayee, 2014, p.240). However, it has been difficult for most leaders in many higher education institutions in sub-Saharan Africa to keep their head above the water in the midst of myriad legacy issues as well as current challenges such as high numbers of young people seeking access to higher education, the growing interest in the use of technologies in education, the lack of competent staff, and, most recently, the Covid-19 pandemic. In these types of environment, leaders are called to manage change by creating and conveying a compelling vision in a strategic and ethical manner (Frantz, Lawack, & Rhoda, 2020). Thus, according to Pityana (2017), a leader’s role is more than just the personality of an individual, but is about leading change and motivating employees, working together as a team, and providing a vision for the institution. Since leaders are expected to lead change, “visions of the future are powerful rhetorical devices to promote change in the present to prepare for the future” (Facer & Sandford, 2010, p.77). It is therefore incumbent on the leader to continuously rethink the future of his or her environment in order to manage changes intelligently and effectively (Frantz et al., 2020).

Since a crisis comes unannounced and requires quick response, it is highly unpredictable, and it is often influenced by the history, the trends, as well as opportunities that change presents. This means that leaders should always be on the lookout for trends and opportunities that will assist them to design a vision that gives them a positive sense of direction (Fergnani, 2020; Inayatullah, 2008; Pham, 2006). This should be facilitated by the images of the desired futures, the drivers of change, and the factors that stand in the way of change (Inayatullah, 2008). It is on this basis that the Inayatullah’s (2008) futures triangle was used to guide the process of examining the personality traits of the distance education leader who is likely to remain resilient in the face of the crisis.

The aim of this chapter is to illustrate the academic leader’s personality traits that are useful in managing change in times of crisis. Nothing challenges a person than leading in times of crisis. There are certain personality traits that are critical for surviving the crisis. Some of the traits are biological, some may be learnt from watching people in leadership positions, and some may be developed through formal professional development and incorporated into the leaders’ regular leadership style. Since this chapter is focusing on distance education leaders in sub-Saharan Africa, it is important to look at some traits that may have been learnt and the historical factors that have influenced management and leadership practices and how these have impacted on the character of a leader. It is therefore important to look at the roots

of the character formation of the distance education leader in terms of their response to what is taking place currently and how those personality traits will enable them to reach the desired goals. The decisions and actions that leaders take in the present is what shapes the future of their institution (Bell, 1997).

---

## Futures Research Triangle

The mapping method of Inayatullah's (2008) futures triangle will be used to contextualize and historicize the character of leadership in the changing distance education environment in sub-Saharan Africa. The futures triangle incorporates three dimensions that include the weights of the past, the push of the present, and the pull towards the future as well as the tensions between them (Fergnani, 2020; Inayatullah, 2008; Pham, 2006). The process of visioning the future is meant to "create the vision that pulls the future forward" (Inayatullah, 2008). The **weight factors** enable leaders to take forward what worked in the past in order to remove obstacles that may stand in the way of change (Fergnani, 2020; Inayatullah, 2008). The **push** factors refer to the current events that influence our thinking such as the Covid-19 pandemic, economic growth, technologies, and social and political pressures; and the weight factors recognises historical practices that are getting in the way to change. It is therefore important to look at the genealogy of distance education in sub-Saharan Africa and the systems and structures that support it.

Each factor in the corner of a futures triangle is influenced by its own set of trends, drivers, and inhibitors (Inayatullah, 2008; Pham, 2006). Trends are an important part of futures thinking, because "they show ways in which the past and the present give rise to the future by forecasting what might happen if a trend were to continue" (OECD, 2019, p.45). However, trends analysis should not be used as an extension of currently existing trends based on a linear way of thinking (OECD, 2019). Instead, they should be used to gather and arrange information to help leaders to envision what is likely to happen in future and how they should respond to it. These factors are also influenced by the drivers of change which are major societal shifts that directs the way towards the future. Drivers of change identify forces that impact on leadership in distance education. Inhibitors also affect the future in a way in that they can bring the whole process of change to a halt. The process of mapping the future requires clear values that underpin the aspirational vision, and the people involved in the production of the vision and the methods (Bell, 1997; Facer & Sandford, 2010). The futures triangle is used to examine some of the factors that mold the character of a leader, starting from where they are coming from, where they are, and what they become due to changes they encounter.

---

## Weights of the Past

Although distance education leaders' minds are often clouded by the current trends, their understanding of who they are and the tools that they use tend to limit their possibilities of thinking beyond the present. When faced with managing a crisis,

decision makers tend to cling to the legacies of the institution, its successes and practices that have survived over the years (Fergnani, 2020). This past may keep them from trying out new things and taking risks.

One way of understanding how some distance education leaders get to lead the way they do is to look back at the history of education in sub-Saharan Africa. By the end of the nineteenth century, virtually all African countries were colonized, mostly by the British and the French who played a major role in shaping education in 80% of sub-Saharan Africa, a home to 46 out of 54 African countries (Ayee, 2014; Sawyerr, 2004; Woldegiorgis & Doevenspeck, 2013). When most countries gained independence in the 1960s, they were faced with a mammoth task of educating large numbers of people who were systematically excluded from education by the colonial powers. In addressing this need, most postcolonial governments developed a number of education policies to guide them as they established higher education institutions in newly independent nations (Makoe, 2018; Teferra & Altbach, 2004). In the absence of education models that were geared towards addressing African needs, postcolonial higher education leaders continued to provide an elitist education system modeled after their colonial powers. The structures, systems, curriculum, and leadership practices remain as relics of colonial dominance in every part of the educational system, making it ill-suited and unresponsive to the development agenda of postcolonial Africa (Teferra & Altbach, 2004; Woldegiorgis & Doevenspeck, 2013).

Although distance education did not gain traction as it was envisioned, postcolonial governments identified distance education as a viable mode of delivery that will enable access to large numbers of people. Despite this, distance education did not take off as expected, and campus-based system continued to exclude large numbers of people who were in desperate need of access to higher education. For decades, South Africa was the only country in the continent that provided university programs via distance mode. The University of Cape of Good Hope, which later became the University of South Africa (UNISA), was established in 1873 initially as an examining center for British universities modeled after the University of London centralized administration and decentralized colleges, many of which later became universities in South Africa (Reddy, 2004; Manson, 2016). The mission of the University of London External Study was based on serving the British “empire with its oppression of peoples all around the world” (Tait, 2008, p.86). The motive of the university leaders at the time was to develop skills for colonial administration workers with a clear mission of executing colonial agendas in Africa (Tait, 2008; Woldegiorgis & Doevenspeck, 2013).

In 1946, UNISA was transformed from being an examining center to becoming the first university to offer higher education courses through correspondence. This was after the British administrators had handed over the management of UNISA to the Afrikaners, whose main purpose was to advance the apartheid agenda, an Afrikaner Nationalist government system of discrimination based on race. The mission of apartheid education leaders was to ensure separate racial development; hence many black people were excluded from participating in higher education in general (Bell, 2001; Reddy, 2004). Although UNISA positioned itself as “an

enterprise dispersing educational benefits to all who earned the right to it regardless of race,” it excluded a vast number of South African populations who could not speak English or Afrikaans (Manson, 2016). While South Africa was the only country in the continent that had several higher education institutions including a distance education university, higher education in other parts of the continent was provided by commercial correspondence colleges. The limited number of public universities in most countries illustrates that there was no political will to provide higher education to large numbers of people in Africa.

Since its inception, distance education was established to widen participation to those people who were excluded from participating in higher education. The role of distance education leaders is to ensure that different types of people irrespective of their age, gender, economic status, and abilities are accommodated and supported. To support students who are geographically separated from their teachers, peers, and the institution, a distance education leader manages interdependent subsystems that work together as a whole (Beaudoin, 2003; Marcus, 2004). Each component of the subsystem addresses structures that have to do with program and curriculum development; facilitation and learning strategies and techniques; development of learning resources and study material; decentralized student support services; and delivery systems that work together to support an individual student who studies on their own using various technologies (Beaudoin, 2003; Nworie, 2012).

All these subsystems are interrelated and interconnected, and if one part of the subsystem is not functioning, it affects all other parts. Therefore, a distance education leader assumes many roles while working in an evolving field that is part of an old system, and operating in a fast-changing environment requiring adaptation of emerging technologies and pedagogies (Nworie, 2012). It is these differences that are often misunderstood by campus-based universities which even question the quality and the legitimacy of distance education qualification. It took the Covid-19 pandemic crisis to move distance education from the periphery to the center. As education institutions faced lengthier shutdown, the expectation was that remote online learning would become a fixture for learning, whether teachers or even leaders were ready for it or not. What was widely overlooked was an overall understanding of what to anticipate in managing technologically enhanced distance teaching and learning. Teaching in an online environment is fundamentally different from classroom teaching and therefore requires resilient leaders who are dynamic and have the ability to apply flexible, creative approaches and provide an enabling environment for online learning (Reed, 2018).

Education leaders, including those in the distance education sector, were totally unprepared for this challenge of managing in time of crisis. By and large, sub-Saharan higher education institutions are often managed by people who do not have the necessary administrative or management skills to effectively lead (Ayee, 2014). In most higher education institutions, leadership is not professionalized, and there is very little interest in training and developing leaders (Beaudoin, 2003; Nworie, 2012; Varghese, 2013). It is assumed that any person who has held an administrative role such as a head of the department or a dean may be a leader in higher education. Yet, leadership is a complex vocation that requires specific

personality traits such as tenacity, perseverance, adaptability, courage to make decisions, to mention a few (Reed, 2018). In some African countries, leadership is so politicized such that academic leaders are appointed by the ruling government (Sawyerr, 2004; Varghese, 2013). Added to this challenge is a general shortage of academic leaders in sub-Saharan Africa due to brain drain, and this situation is worse in distance education institutions (Varghese, 2013).

The legacy of education in sub-Saharan Africa has a lot to do with the current practices of academic leaders. Many of the practices resemble those that were used by colonial academic leaders whose main aim was to create obedient and submissive Africans. To this day, the inherited higher education system still pays little attention to the social, economic, and political needs of most African countries. It is therefore important that current leaders identify those areas from the past that they need to leave behind and those that they can take forward in order to provide a vision that will transform distance education institutions from the industrial based system to a technologically enhanced learning environment. The shortage of competent leaders in some higher education institutions, as well as the inertia of systems, structures, and practices inherited from colonial and apartheid (in the case South Africa); and the failure of implementation of policies are the weights that pulls distance education leaders away from acting effectively when faced with crisis.

---

## The Push of the Present

Over the past 30 years, distance education leaders have had to deal with social, economic, technological, and political factors that are pushing distance education towards the future. These factors have been influenced by the changing needs of the emerging economies, the growing number of young people who seek access to higher education, and the impact of the Covid-19 pandemic on the education sector (Inayatullah, 2020; Wangenge-Ouma & Kupe, 2020). Ill-equipped for these challenges, distance education leaders found themselves faced with massive and complex challenges with no clear solutions in sight. These drivers that push for change require “innovation, risk taking, and continuous learning; and new skill sets that traditional strategies of the past are not sufficient to address” (Mrig & Sanaghan, 2017). It is at this point where distance education leaders need “to be informed and enlightened enough to ask fundamental questions that could well influence their institution’s future viability” (Beaudoin, 2003, p. 1). As decision makers, leaders need to predict what is essential for their institution in order to develop appropriate policies and implementable strategic plans that enables them to adjust and adapt to the new distance education environment. In a constantly changing environment, distance education leaders need to have a well-founded vision that will take the university forward to the future (Beaudoin, 2016; Pityana, 2017; Nworie, 2012). It is precisely during times of crisis that resilient leaders are needed because of their ability to be innovative in ensuring that teaching and learning, research, as well as community service occur in the midst of all these challenges.

Although most of the changes, with the exception of Covid-19, have been on the horizon for some time, they were largely ignored despite their huge potential to reshape the distance education sector. One such driver of change is the growing number of young people. It has been projected that the population of sub-Saharan will double in 30 years and close to 60% of those will be younger than 25 years of age (Roser, 2020; UNESCO, 2021). This indicates that distance education leaders need to put plans in place to ensure that these large numbers of people are absorbed in higher education. If Africa's young people receive the right education and training geared towards the development of the continent, they will provide an unparalleled comparative advantage that will accelerate the economic growth of the continent (Roser, 2020). However, Africa has been lagging behind in terms of people who complete their basic education, let alone higher education. Africa produces less than 2% of research outputs, and it is in serious need of high level skills needed for the knowledge economy, according to a World Economic Forum survey (WEF, 2017). Africa's most important resource is its young population who currently do not have access to higher education. Therefore, there is a dire need for the whole education ecosystem to engage in discourses that will ensure that young people are equipped with high level skills, qualifications that are relevant to the economic and the development needs of their respective countries, and effective programs for those who need skilling and reskilling (UNESCO, 2021; WEF, 2017). Studies have shown that countries that have thriving economies are those whose higher education participation rates is more than 50%, while most sub-Saharan African countries have less than 5% of people in higher education (Altbach, Reisberg, & Rumble, 2009). Given the limited number of universities on the continent, it therefore makes sense that open and distance education systems are better positioned to address this need for an affordable, scalable education system. This will ensure that there is capacity to service the struggling economies of developing countries.

While higher education institutions were grappling with challenges of inadequate systems, Covid-19 pandemic hit with lockdowns that forced every person to work remotely. Even distance education institutions that were supposed to be trailblazers in online learning did not have the necessary infrastructure and resources to support this mode of delivery. The Covid-19 pandemic provided a unique opportunity for distance institutions to start addressing the needs of people who are forced to upskill and reskill to effectively function in what is considered the new normal. However, some distance education leaders failed to leverage on opportunities provided by the pandemic. The lack of preparation for eventualities tends to be the biggest drawback for academic leaders. This is further exacerbated where leaders are forced to focus on day-to-day operational matters and, in the process, neglect the risks that may arise due to unforeseen circumstances that impact on the practices of the sector.

Higher education institutions that are going to be resilient in future are those that are going to utilize technology to change its practices (Weller & Anderson, 2013). Practices such as teaching, administering, and managing processes in distance education rely entirely on robust information and communication technologies (ICTs) infrastructure, and agile systems and structures that support online pedagogies. All these require resilient leaders who possess broader sets of skills that show

that they have deeper understanding of how technology works and how to manage it (Redecker & Punie, 2013; Weller & Anderson, 2013). Although the use of technologically mediated forms of teaching and learning are as old as distance education itself, many African distance education institutions do not have the necessary financial resources to adopt new technologies. Inadequate facilities and infrastructures, problems of quality and relevance to the current labor market, limited capacity of teaching and research, critical shortage of faculty, and huge brain drain are some of the major challenges faced by distance education leaders (Ayee, 2014; Wangenge-Ouma & Kupe, 2020; Woldegiorgis & Doevenspeck, 2013). Given these and other pressing questions, decision makers must clearly understand all influencing factors. It is therefore important that leaders pay attention to these signs, according to Mrig and Sanaghan (2017), because leaders should be constantly thinking about the future while managing today's challenges. The future calls for resilient leaders who will be able to take more responsibility in all matters concerning the institutional affairs (OECD, 2020; Redecker & Punie, 2013).

---

## The Pull to the Future

Moving distance education forward requires leaders who are constantly reviewing current trends, adapt to changes, and initiate solutions to problems (Portugal, 2006). The history that brought distance education to where it is now and the drivers that push these institutions to change requires resilient leaders who can pull the vision of the institution forward. The drivers that pull the future forward communicate aspirational ideas that have a potential to empower the leader to have confidence in moving the institution forward (Inayatullah, 2008). The visioning process of what distance education leaders should aspire for should be guided by the type of skills and knowledge they may need to empower themselves to steer the institution to the desired future. It therefore makes sense that leaders should draw on their personal efficacy and their support base to survive in a rapidly changing environment. "Resilience is fundamental to sustainability, in enabling individuals and communities to manage crises and disruptions, and to find alternatives" (Hall & Winn, 2011, p. 348). Resilient leaders have a clear sense of purpose and meaning, and they make do with what they have and never focus on what is missing when they meet difficult challenges (Couto, 2002; Sanaghan, 2016). This shows that resilience is a necessary trait and skill every distance education leader should develop and possess especially in times of turbulence (Couto, 2002; Sanaghan, 2016). The good news, according to Sanaghan (2016), is that "resilience can be developed with deliberate and conscious actions on the part of the leader" even though the process of building this trait may take long.

The development of a resilient leader should start by understanding the context of leadership in the present, and how it was influenced by the past. The findings of Dumulescu and Muțiu (2021) study of academic leaders during Covid-19 revealed that personal attributes such as responsibility and adaptability helped leaders adopt strategies to deal with the changes created by the pandemic. From a practical

perspective, there is a need for development of leadership programs that will train people on how to adapt and find best ways to address any challenges that they may face (Dumulescu & Muțiu, 2021). Resilient leaders require three skills sets, according to Reed (2018), and these include resilient thinking skills, resilient capacity building skills, and resilient action skills.

1. Thinking skills requires leaders to view their current reality and assess its probability to influence the future. Therefore, it is expected that the leader should be optimistic about the future while dealing with the current adversity.
2. Capacity building skills have to do with the personality that a leader possess. These includes personal values that goes beyond the crisis period. Personality and self-efficacy traits are not situational, but they regulate a person's behavior when dealing with the current situation.
3. Action skills focuses on the leader's ability to make decisions with confidence and conviction. Flexible and creative approaches are needed by leaders to successfully traverse through stumbling blocks created by adversities (Reed, 2018). These actions highlight the benefits of proactivity where a leader is not only in control of a current situation, but also, he or she is mentally and physically prepared to change the environment by providing the vision for the future (Reed & Reedman, 2020).

The first two are necessary, but the third one is crucial in carrying out the demonstrated abilities to act, according to Reed (2018). The action-oriented skills were what the retired academic leaders in South Africa mentioned as crucial in steering the transformation of universities in the early 2000s (CHE, 2016). In the past two decades, higher education in South Africa went through a series of dramatic changes that were meant to address a deeply divided education sector. It was during these periods of extreme change that leaders were expected to find ways to manage in an extremely insecure environment. It was, therefore, incumbent on the academic leaders at the time, to ensure that people are motivated to carry on with their work. To achieve this, leaders needed to understand the character of the people that they are leading. The higher education sector is inclined to attract creative people who focus mainly on creating innovative ways of looking at things and finding solutions and therefore these individuals find it extremely difficult to be micromanaged. In fact, they work best in environment that allows them to be creative, that engages them, and that acknowledges their contributions to projects that drives the transformation agenda, according to one of the retired leaders (CHE, 2016). In this instance, a leader should lead from the back, by recognizing and supporting as well as leading from the front, by showing how it is done (Ramsden, 1998).

Academic leaders who lead from the front are those that contribute to the development of future leaders through sharing responsibilities with others. The academic leaders' role in times of crisis is to set the institutional priorities and distribute responsibilities to the team and allow them to assume the responsibility of their own decisions while increasing the sense of empowerment of each member of the team (CHE, 2016; Dumulescu & Muțiu, 2021). This approach allows teams to

make connections with people at different levels and that way every member of the institution gets involved in the changes that are taking place. In addition, leaders are expected to provide a vision and direction and allow the team to work towards accomplishing institutions' mission (Ramdass, 2015). This type of resilient leadership requires mindset change and attitudes that embrace new ways of leading change.

Distance education institution that will remain relevant in future are those that have resilient leaders who learn, grow, and adapt to constant changes that are taking place around them (Reed, 2018). These types of leaders will be the ones who see lessons embedded in every challenge they encounter (Couto, 2002). They also have the capacity to identify trends, look for opportunities in a crisis, and understand strategic implications embedded in the challenges. Distance education leaders, according to Beaudoin (2016), operate in a rapidly changing environment that requires an agile system that will change swiftly. The pervasiveness of the mobile technologies and internet in sub-Saharan Africa; the automation and the flexibility of working environments; the growing number of people seeking spaces in higher education are all pushing distance education leaders to think critically on how to prepare people to perform effectively in the future environment (WEF, 2017). Based on these drivers, researchers anticipate that the future of education will be digital, open, flexible, collaborative, and personalized (Muñoz, Redecker, Vuorikari, & Punie, 2013; OECD, 2020; Redecker & Punie, 2013). To prepare for this future, distance education leaders need to invest in technological infrastructure, systems, and structures that are needed to support the use of technologies to enable flexible, open, and personalized ways of learning. This can be achieved if distance education leaders commit to building their own resilience by learning from the past and reflect on the present in order to catapult to the future they want. Resilience is an ongoing learning and developmental experience that provides leaders with competencies they need to lead with greater confidence while gradually preparing themselves and their subordinates for future (Reed & Reedman, 2020). Even though leaders' specific roles are clearly defined, "the effective application of management tasks is strongly dependent on leadership self-efficacy, personal attribute, shared trust, common goals and perceiving the change and crisis as opportunity" (Dumulescu & Muțiu, 2021, p.8).

---

## Conclusion

The discussion in this chapter illustrated that adaptive challenges facing distance education will demand resiliency, because setbacks and mistakes will be made; yet, there is a need to move forward (Hall & Winn, 2011; Mrig & Sanaghan, 2017; Reed, 2018). Despite the social and economic changes that are taking place in African countries, distance education leaders "must develop a deeper foundation of balance to manage on-going and future challenges" (Portugal, 2006, p.8). All these requires resilient leaders who are not held back by the weights of the past, but who are willing to learn from the past, strengthen what is working, and move forward to the desired

future. What was clear from this chapter was that there is a need for leadership programs that will equip academic leaders with skills and knowledge on how to navigate jerky and shifting environments in distance learning. “Leading wisely, involves a balance between personal philosophy, vision, pedagogical knowledge, and a willingness to transcend daily challenges and/or political struggles” (Portugal, 2006, p.8). The sustainability of distance education is dependent on resilient leaders who have the ability to learn and adapt to changes while responding to challenges by framing contextually responsive solutions for the sector (Hall & Winn, 2011).

**Abstract**

Recent monetary policies of quantitative easing have produced a cognitive dissonance with the previous “there is no money” mantra and invite us to revisit our understanding of the costs and economics of distance education (DE). It turns out that study of the costs of DE was narrowly rooted in neoclassical microeconomics. Consequently, DE has focused on driving down costs and devolving costs to the students, thereby contributing to increasing student debt. The chapter summarizes the efficiency gains of traditional DE and their changes due to the emerging affordances of information and communication technologies (ICT). The chapter also notes changes in the “macroeconomic weather conditions,” which have led to regarding education less as means to raise productivity than as a center for profit itself. As a consequence, cost efficiency gains have often not

T. Hülsmann (✉)  
University of Oldenburg, Oldenburg, Germany  
e-mail: [thomas.huelsmann@uni-oldenburg.de](mailto:thomas.huelsmann@uni-oldenburg.de)

been handed to the learner, leading to rises in tuition fees and, consequently, student debt.

The second half of the chapter introduces modern money theory (MMT), a different economic paradigm, which suggests that monetary sovereign countries have enough policy space not to focus narrowly on driving down costs. It notably suggests that devolving costs to students turns out, from the MMT perspective, to be misguided. It identifies a policy space which can be used to build in additional resilience, especially required in times of crises.

**Introduction: Crises, Money, and the State**

The last decades have been characterized as a time of global crises. There was the Global Financial Crisis (GFC) 2008, and there is at present the Covid-19 pandemic and, in the offing for quite a while, the climate crisis.

The GFC was a crisis emerging from internal contradictions of neoliberalism (which is considered here as a political translation of neoclassical economics), while Covid-19 is generally seen as an external shock, though, obviously through urbanization and globalization, the virus found it easy to spread. The climate crisis, announced already in the 1970s (Club of Rome), increasingly enters the headlines.

All three crises have in common that they force one to rethink the understanding of money and the state. Especially, after decades of austerity politics (accompanied by the mantra “there is no money”), the experience that, in response to the GFC, it was possible to flood the global economy with large sums of money created a widespread cognitive dissonance (“where does all this money suddenly come from?”). Moreover, while the role of the state had been denigrated for a long time as inefficient, the US government (the Treasury and the Federal Reserve Board, FED) had to bail out the banks (though not the people) in order to stabilize the system (Adam Tooze, 2018).

Similar things have happened during the Covid-19 crisis. Governments began pumping large sums into the economy in ways inconsistent with the neoclassical “no-money” mantra. The measures were regarded as temporarily suspending the policies of “solid finance” (keeping government expenditure within the limits of tax income and bond sales). It has already been announced by most governments that all debts will have to be paid back once the Covid-19 pandemic is over. The coming climate crisis, as already understood, will again require governments to find huge sums of money in order to restructure the economy. The climate crisis combines internal and external contradictions and imposes objectives which are unlikely to be met by leaving investment decisions to profitability considerations alone.

These three crises require us to reconfigure the usual understanding of money and the state. Modern Money Theory (MMT) claims to have a different and empirically more grounded concept of money and the state, which allows for identifying a policy space which is far wider than neoclassical economics allows for, and which could accommodate the pressing policy agendas related to these crises.

What has all this to do with distance education (DE)? A short summary of the history of DE from a costing perspective forms the basis for the argument that much of the understanding of the costs and economics of DE has been shaped by (neoclassical) microeconomics with a focus on driving down unit costs and, still consistent with neoclassical policy recommendations, devolving the costs to the learners.

MMT suggests that the microeconomic focus is too narrow, and that embedding the costs and economics of DE and online learning in a macroeconomic context would lead to a more realistic analysis and, consequently, better policy responses. In particular, it advances the notion that devolving cost to the learners, in MMT terms “users of the currency,” is misguided.

---

## A Brief History of DE from a Costing Perspective

The founding of the Open University of the United Kingdom (OUUK) in 1969 will be taken as a point of departure for the purposes of this discussion, although DE is much older than that. DE at the time was intended to widen access to education, much in line with the Universal Declaration of Human Rights (1948), which included a right to education. The Organization of Economic Cooperation and Development (OECD) considered education as an important investment to sustain economic and technological superiority. It was observed that the socialist rival already successfully tapped the cognitive resources of the working class as well as those of women. The Sputnik shock of 1957, when the Soviet Union launched the world’s first artificial satellite, was taken in the West as an alert to reform education in order to widen participation beyond its traditional audience (Papadopoulos, 1994). For the developing world, Coombs called for reforming education to make it more efficient by introducing more division of labor (Coombs, 1985). The health services had successfully started on this path, and the author suggested that education should follow.

In this summarized walk through the history of DE, three phases will be distinguished: Traditional DE, online DE, and ODDE (open, distance, and digital education). The headings are not meant to signify the substitution of one phase by the next but rather are meant to emphasize newly emerging aspects.

### Traditional Distance Education

Coombs’ propositions, cited above, were echoed in Peters’ theorization of DE as the “most industrial form of education” (Peters, 1983). Peters was clear that to use

technology and division of labor renders education more cost-efficient and, therefore, more accessible.

Traditional DE will be used here as backdrop against which later changes in the cost structure of DE are made visible. The reference frame for analyzing the costs of DE is the cost of traditional campus-based education.

With its lecture halls, libraries, sport facilities, student accommodation, catering, and similar amenities, conventional campus-based higher education (HE) is clearly quite costly, such that it can be taken for granted that the total costs of campus-based education are higher than the total cost of DE (for a given number of students). More interesting is that, even if you strip down total costs to those elements directly impinging on teaching and learning, the costs of DE still can be expected to undercut those of conventional education (Fig. 1).

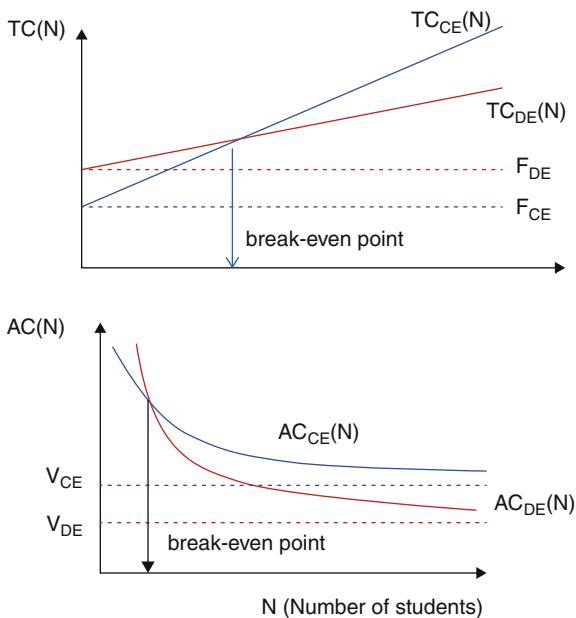

The obvious structural reasons for the cost efficiency of DE can be identified by revisiting the basic cost equations:

- (i)  $TC(N) = F + V \cdot N$  and
- (ii)  $AC(N) = F/N + V$

(TC stands for Total cost, F for Fixed cost,  $V \cdot N$  for Variable cost, and N for the Number of students. AC for Average cost per student. For N increasing, AC (N) approaches V, the variable cost per student or unit cost.)

Hence, as in many industrial processes, cost efficiency is achieved by a combination of capital for labor substitution and labor for labor substitution (meaning a

**Fig. 1** Total and average cost equations

substitution of more costly by less costly labor) to capture scale economies (SE). How is it possible for DE to achieve this?

DE shifts costs to course development (a fixed cost). The development of DE courses often involves not only the subject matter expert, but also instructional designers and media experts (Koumi, 2006). Course development includes the tests/exam questions as well as evaluation rubrics. Even if, in order to ensure the quality of the course material, course development costs in DE may be higher than in CE (conventional education), total costs of DE rise slower than total costs of CE, such that, for a sufficiently high number of students ( $N$ ), it holds that  $TC_{DE}(N) < TC_{CE}(N)$  (Fig. 1, upper part). Recall, that  $V$  (the variable cost per student) determines the inclination of the graph of the (linear) total cost equations. Hence, in order to be cost efficient, it is important for DE that  $V_{DE} < V_{CE}$ . To keep  $V$  low, DE reduces contact with the teacher and/or “unbundles” the teacher role into various functions, which then can be remunerated differently. Teaching in traditional DE was identified with course development (Mills, 2003, p. 104), which is a fixed cost (contributing to  $F$ ) and not part of  $V$ . Contributing to  $V$  is course presentation, as well as student support and the marking of assessments. Hence, it is possible to keep  $V$  low by using tutors or adjunct lecturers as compared to professors of subject matter experts. Not only are they remunerated at lower rates, but also often they are on shorter-term contracts and paid per task. In Fig. 1 (lower part), one can observe that the average costs asymptotically fall toward  $V$  and that, if  $V_{DE} < V_{CE}$  for  $N$  sufficiently large,  $AC_{DE} < AC_{CE}$ .

Two further insights present themselves: first, that  $AC$  cannot fall below  $V$  (even if you multiply student intake for the course); second, scale economies (SE) do erode, and eventually quite quickly. Planners should not be misguided by the promise of scale economies. Daniel is right that DE can widen access while, at the same time, bring down costs, thus “breaking the iron triangle of cost, access and quality” (Daniel et al., 2009). However, the Daniel argument comes with a sleight of hand: While average costs fall, total costs rise and possibly beyond what the institution can afford (Avoiding the income trap, Butcher, 2004, January, p. 20 ff).

While there are structural reasons for expecting DE to be more cost efficient in terms of cost per student, the same level of cost advantage does often not carry through to comparisons in the cost per graduate (Rumble, 2014). This is due to the often very high dropout rates in DE:

$$\text{Cost per graduate} = \frac{\text{cost per student}}{100\% - \text{wastage}}$$

Hence, the cost advantage of DE shrinks due to the often-higher dropout (wastage) rates in DE. The cost efficiency of DE (cost per student) is often so much lower (i.e., “better”) that it can accommodate a considerable level of dropout, before its cost effectiveness falls below that of its conventional competitor (Raza, 2008, pp. 497–498).

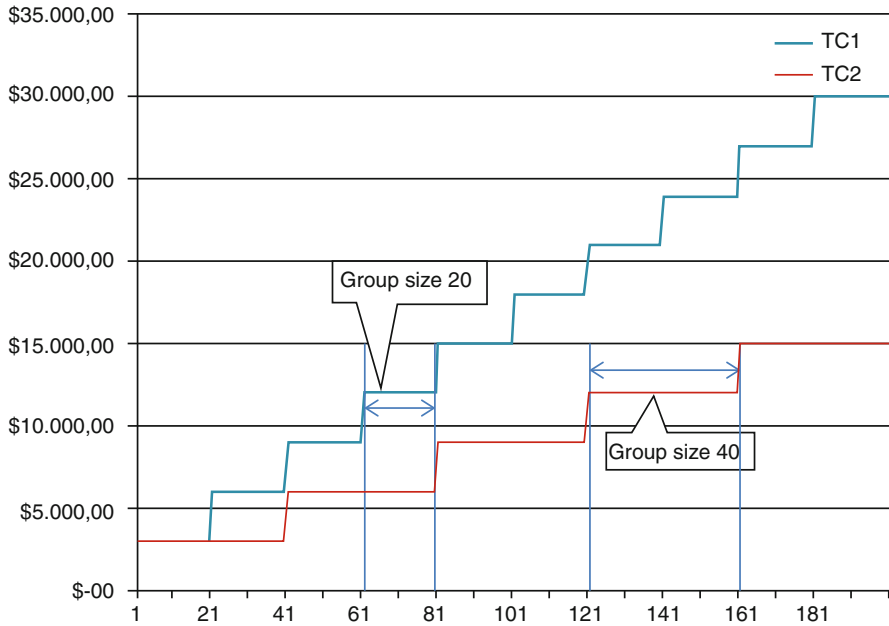

While the higher dropout rate in DE could be brushed aside by pointing at the different characteristics of the DE audience, another criticism of DE weighed

heavier: the lack of interaction between the student and teacher in DE. Educators quite often see personal interaction as closely linked to the quality and effectiveness of teaching and learning. However, somewhat surprisingly, distance educators also claim interaction for DE. For example, Holmberg argued that, by building some instructional design features into the course material (such as in-text questions and in-text activities) and adopting a more empathetic conversational style in course presentation, the course material itself could be designed as guided didactic conversation, which can trigger an inner monologue which he referred to as “simulated communication” (Holmberg, 1983, 2008). Moore (arguing along similar lines) distinguished three main forms of interaction in DE (Moore, 1989): student-content interaction (SCI), student-teacher interaction (STI), and student-student interaction (SSI). Since not all distance educators found Holmberg’s guided didactic conversation a convincing substitute for student-teacher interaction and interaction among students (Rumble, 2001, p. 3), traditional DE usually included opportunities for face-to-face meetings in evening classes or weekend seminars. Paradoxically, students typically wanted it to be available more than they actually made use of it. It certainly was a factor to drive up the cost of DE.

## Online Distance Education

The development of information and communication technologies (ICT) brought new affordances for DE impinging on all three forms of interaction. Hülsmann (building on Rumble 2004) referred to features following from the information-processing aspects of ICT as type-i affordances and to features following from the communication-enabling aspects of ICT as type-c affordances (Hülsmann, 2014, June, 24, p. 244). Type-i affordances include automated responses or simulations, including the learning objects (LO) and, more recently, features based on artificial intelligence (AI) and machine learning, which are applied in learning analytics (LA). All these features can be used to enhance SCI, far beyond the early design features of in-text questions and in-text activities. While much of this (e.g., LA) allowed developing a more precise learner profile, enabling institutions to better support students, it also allowed the close surveillance of students and staff with concomitant ethical issues (Slade & Prinsloo, 2013).

Type-c affordances for the first time in the history of education allowed responsive interaction at a distance, both between teacher and students (STI), and among students (SSI), inaugurating a new paradigm of teaching at a distance (Garrison & Anderson, 1999). This allowed keeping the teaching/learning experience closer to the “normal” experience in schools or universities, since the notion of class and the teacher were re-introduced into DE (Bernath & Rubin, 1998; Hiltz, 1995). The changes were also welcomed by many distance educators, since the previous lack of responsive interaction was perceived as a major educational handicap. However, it soon became apparent that the advantage came with eroding DE’s potential for scale economics (SE), which is a major selling point for DE. One can see this by adapting the cost equation to the situation of online learning (Fig. 2):

**Fig. 2** Total costs in online education. (Note: Introducing the classroom changes TC into a step function. The larger the class size, the lower the rate of increase in total costs)

$TC(N) = F + [N/G]*SV + V*N$  where  $G$  indicates group or class size and  $SV$  the semivariable costs, incurred when an additional class has to be opened.

After a regrouping of terms:

$$TC(N) = F + [SV/G + V] * N$$

Since  $SV/G > 0$ , it is obvious that online DE raises unit costs:

$$AC(N) = F/N + V^0$$

where  $V^0 = SV/G + V$ .

Since  $V^0 > V$ , the online form of DE shifts the break-even point further to the right (i.e., you need, other things being equal, more students to break even) (Thomas Hülsmann, 2016, p. 48).

The lower the cost of the teacher ( $SV$ ) and the larger the acceptable class size ( $G$ ), the higher the potential for scale economies. The in-built contradiction of pursuing, on the one hand, the aim of bringing down costs through economies of scale, while on the other hand trying to achieve effectiveness (quality) through improved responsive interaction, was captured in the incompatibility theorem: More scale economies (SE) require restraint in student-teacher interaction (STI) and emphasizing STI erodes SE (Hülsmann, 2014, June, 24).

The realization that online learning with higher levels of STI erodes SE cooled down the initial enthusiasm of the early promoters of a more responsive DE. Anderson had welcomed the new affordances of interaction in the paper on “big and little distance education” (Garrison & Anderson, 1999), but soon adjusted his position in “Getting the mix right” (Anderson, 2003) and, especially, in “Disruptive pedagogies” (Anderson & McGreal, 2012).

Two other findings have further influenced the reassessment of the importance of interaction (and especially STI). The first was the research by Bernard et al., who investigated the relative effectiveness of different forms of interaction (Bernard et al., 2009). Surprisingly, it turned out that among the three interaction formats, SCI was rated first and STI last. This finding was a boon for the proponents of big distance education. Daniel and his team hence were quick to draw the obvious conclusion:

Some important research by Robert Bernard . . . , explodes the myth about the importance of face-to-face support. They carried out a meta-analysis of hundreds of studies in which distance-education students were treated in different ways. They distinguished three types of interaction: student with content; student with student; and student with teacher. They then analyzed all the studies to find which type of interaction made the greatest difference to student performance when it was increased. The results showed clearly that increasing student–content interaction had much the greatest effect, with student–student interaction coming next and student–teacher interaction last. (Daniel et al., 2009, p. 34)

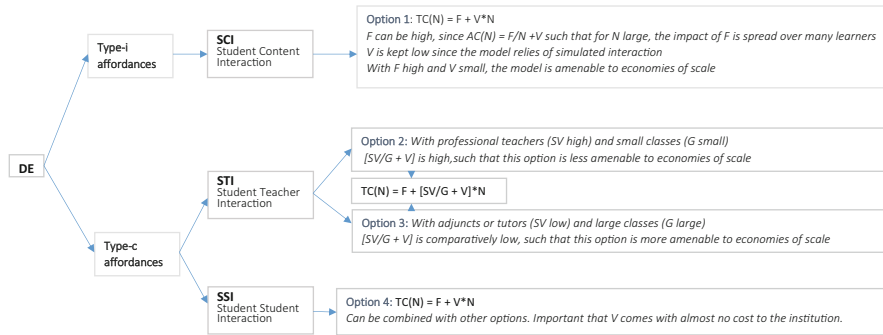

The second major finding was the Interaction Equivalency Theorem (IET), proposed by Anderson and later by Miyazoe and Anderson (Terry Anderson, 2003; Miyazoe & Anderson, 2010, 2012). The IET states:

Deep and meaningful formal learning is supported as long as one of the three forms of interaction (student–teacher; student–student; student–content) is at a high level. The other two may be offered at minimal levels, or even eliminated, without degrading the educational experience.

High levels of more than one of these three modes will likely provide a more satisfying educational experience, though these experiences may not be as cost or time effective as less interactive learning sequences. (Anderson, 2003, p. 4)

The gist of this theorem resonates with the study mentioned earlier (Bernard et al., 2009). It allows the interpretation that all three forms of interaction can be considered equivalent, and that, to achieve deep learning, only one of the interaction formats needs to be developed at a high level. If all the interaction formats are equivalent, but have very different cost implications, the obvious conclusion is to go for the least costly option. (For the spectrum of teaching options and their respective cost structures, see Fig. 3.) It is quite convenient to find what is educationally the best and turns out to be the cheapest option. *Honi soit qui mal y pense.*

Within DE, discussions such as developing the concept of a community of inquiry (CoI) (Arbaugh et al., 2008)) dominated the field and usually proved more innovative than most studies on costs.

**Fig. 3** Spectrum of options

The new affordances of ICT created a sort of identity crisis in DE (Guri-Rosenblit, 2008) as indicated by the plethora of new terms and acronyms, such as online learning, e-learning, virtual classrooms or virtual seminars, technology-enhanced learning (TEL), and, more recently, open, distance, and digital education (ODDE).

### Open, Distance, and Digital Education (ODDE)

The term ODDE is used here, not to indicate that a new form of DE has taken over from online DE. It is meant to highlight the implications of the digital aspect beyond what was emphasized for online DE. Online DE had inaugurated a new DE teaching option, which reintroduced the use of the class due to the type-c affordances of ICT to sustain responsive interaction at a distance, especially between student and teacher (STI) and among students (SSI). This led to raising the V component in the total cost equation, since time spent in personalized teaching and supporting students is possibly the major factor contributing to V. Increasing V, it was argued, decreases the potential for scale economies (Fig. 3).

STI is, however, not the only factor contributing to V. The other factor is the cost of replication and distribution (RD) of course material. In traditional DE institutions, which often still operate using print material and still distribute it via the postal services, RD remains a significant cost factor. Once the teaching material is digitally captured and the institution is linked to the Internet, these costs fall to close to zero.

The realization that digitally captured knowledge can be made available to all with access to the Internet at minimal costs has huge consequences. It challenges business models in publishing (Open publishing) (Anderson, 2013; Willinsky, 2006) and inaugurated the open educational resources (OER) movement, which dates back to the 2001 MIT publicity coup (MIT OpenCourseWare) to open its archives to the world (at least as far as the world has access to the Internet) (Butcher, 2011).

The step from OERs to massive open online classes (MOOCs) is small. Once ivy-league institutions realized the wealth of the already digitally captured educational resources in their archives, the question arose, why not make them available as

courses? The fixed costs of development are zero and, as long as no personalized learner support is promised,  $V$  also is zero ( $V$  is composed of an STI and an RD factor; the first was zero by design, the second zero due to the fact that RD of digitally captured knowledge over the Internet is zero). Hence:

$$TC_{MOOC}(N) = F_{MOOC} + V_{MOOC} * N = 0$$

Obviously, this is a somewhat stylized version, since moving a course into the international limelight was, at least in the early days, a publicity coup. Pulling a course out of the archive and turning it into an MOOC required more than “a bit scrubbing” (Weller, 2014, p. 79). Hollands and Tirthali collected data about the costs of developing MOOCs varying between \$ 30,000 and \$ 300,000 (Hollands & Tirthali, 2014). For instance, to compensate for the lack of personalized support, the inserted quizzes (a more responsive version of the old in-text questions) are instantly evaluated, the data being fed back to the design team to ensure improvements in the next course presentation (Koller, 2012).

If MOOCs can be regarded as “traditional DE reloaded for the digital age” (radicalized in increasing  $N$  and reducing  $V$ ), it comes as no surprise to find it being beset with the same problems (also in a more extreme manner): Completion rates in MOOCs are low, according to some authors below 13% (Ahrache et al., 2013). It turns out that MOOCs require an already seasoned, autonomous, and resilient learner, perhaps even more so than does traditional DE.

The concept that MOOCs were meant to be open (i.e., free to the learner) attracted considerable public attention. In the wake of the GFC, when Higher Education (HE) funding had been cut back at a time when HE was becoming increasingly necessary for a better job, tuition (in the USA and the UK) soared way beyond home prices and the consumer price index (Thomas Hülsmann, 2016, p. 22). Education appeared to be “broken,” unable to serve as a vehicle for upward mobility. In this situation, MOOCs emerged with the promise to rebuild HE in a very American way: through the combined forces of technology and venture capital (Bates, 2015, p. 176). However, the very openness presented a problem for this combination. Being open, MOOCs did not, at least in the early days, produce any substantial streams of revenue.

## From HCT1 to HCT2

This gives the opportunity to comment on some changes in the “macroeconomic weather conditions.” Early human capital theory (here labeled HCT1, to distinguish it from a later mutation) was based on the perception that education would raise general productivity and should be seen as an investment. The profitability crisis of the 1970s, however, inaugurated the neoliberal project in major capitalist countries (Todaro & Smith, 2003). Margaret Thatcher famously declared that “there is no society but only individuals” and that “all the money the government can dispose of is taxpayers’ money,” which, everybody knew, was scarce. Consequently, selling off

public monopolies such as roads and other infrastructure was turned into opportunities for rent extraction. “This turns the economy into a set of tollbooths as user-fees raised on labor, industry and other non-financial ‘real’ activity” (Hudson, 2012). The user of the highway pays a fee for using it, the ill have to pay for their treatment, and the students for their education. Since social surveys indicated that the educated enjoy higher lifetime earnings than the less educated, students can be expected to take out loans for their education (Hülsmann, 2011; Spraul, 2006), a development here referred to as HCT2. The perception of HCT in education had changed: While earlier it had been seen mainly about enhancing societal productivity (by reducing, for instance, overhead costs coming with training), the changed perception now regarded education as a center of profit itself.

In education, this shift led to various attempts to participate in the education market. An early attempt was to open for profit universities. This proved not to be too successful (Hanna, 2003, p. 69). More promising were the inroads in the HE market due to the proliferation of ICT in education. Universities were among the first to be connected to the Internet. They found the emerging web-based learning management systems (LMS) useful, also on-campus.

When, in the wake of the GFC, much of the HE funding was slashed, universities looked for diversifying their income streams. Educational technology (EdTech) providers already played a prominent role in various services. It seemed a win-win situation for HE and EdTech providers to join forces. In some cases, the entire online management programs (OMP) were outsourced to EdTech companies, which allowed increasing student intake. The added revenue (fees) were split between the university and the OMP provider. At times, the bigger share (60%) goes to the EdTech provider, which still helps the HE institution since it gets 40% instead of, as before, nothing (Carey, 2019, February 6).

After this short *tour d’horizon* of DE costs structures, the potential of DE in terms of cost-efficiency should be plausible. However, the rising tuition fees in many countries suggest that, in spite of bringing the unit costs down, the cost-efficiency gains were not handed down to the students. Instead, devolving costs to the students compensating for reduced state funding, often increased tuition, and in the wake, student debts.

---

## Modern Money Theory (MMT)

Earlier in this chapter, it was argued that the present three crises require reconsidering the understanding of money and state. In the next section, the history of DE with a focus on its economic aspects was revisited. It was shown that the costs and economics of DE had been framed by the neoclassical economic paradigm predicated on an implicit understanding of money and state. According to this paradigm, the only money the state disposes of is the scarce taxpayers’ money. In this frame, it seemed plausible to devolve educational cost to the students who, after all, are supposed to benefit from it in terms of higher lifetime earnings.

MMT has a different understanding of money and state. For MMT, any analysis that confines the costs and economics of DE to the perspective – anticipating MMT terminology – of the users of the currency is insufficient. Education, like health and infrastructure, has traditionally been under the purview of government, which, in MMT terms, is the issuer of the currency. Since money in the chartalist MMT tradition is a creature of law and, by extension, the state (Knapp, 1905), money is neither scarce, nor is it necessarily taxpayers' money. Therefore, MMT would arrive at different consequences for the costs and economics of DE by (i) exposing its traditional microeconomic focus as too narrow and (ii) devolving educational costs to the learner as misguided.

## MMT Basics

Inspecting the understanding of MMT, it shows three important features:

1. Money is a creation of law (and by extension of the state).
2. The acceptance of money is driven by taxes.
3. Money can be understood as tax receipt (tax credit).

The first point situates MMT in the chartalist tradition. Chartalism sees money as a creature of law (Knapp, 1905). MMT starts with a distinction between the issuer and the users of the national currency (Mitchell et al., 2019). All citizens, all private sector institutions, and even local governments are users of the currency. The sole legal issuer of the currency is the government. MMT usually refers to the government (or “consolidated government”) as the ministry of finance and the central bank together (in the USA, the Treasury and the FED).

In the chartalist tradition, money has no intrinsic value and is often referred to as fiat money. That distinguished it from an earlier metallist tradition, which saw money as being tied to gold or silver. Since the end of the gold standard (1971), the links to the metallist tradition were severed inaugurating the modern fiat money economy. The question, how governments were able to get an intrinsically valueless currency accepted, leads to point two of the list above: The acceptance is driven by taxation. The government holds two monopolies: the monopoly of power and the monopoly to issue the national currency. By imposing taxes payable in its own currency, the government creates a demand for its (intrinsically valueless) currency. For example, between 1755 and 1774 the state of Virginia issued its own currency. Having to pay taxes in Virginia, Pounds (£<sub>VA</sub>) colonists were forced to offer part of their resources (most importantly labor) to earn the state's currency. Grubb reported that the tax money “redeemed” was literally burned (Grubb, 2015; Wray, 2019). Since all colonists had to get hold of the currency to pay their taxes, the intrinsically valueless £<sub>VA</sub> notes were accepted as general means of payment.

The (general) stylized story that MMT tells is that first the government agents (soldiers, police officers, judges, administrators, etc.) were paid in the government's currency. They would accept the government's currency, since they could buy

anything with the government's money such as shoes and shirts and bread, because the shoemaker, the tailor, and the baker also urgently needed to get hold of the government's currency for paying their taxes. In this way, "taxes drive money" (Mitchell et al., 2019 p. 137) or, more precisely: Taxes drive the acceptance of the currency. Note that, by setting the salaries of its agents, the government defines the reference frame of labor costs. The salaries have to be sufficiently high for the government's agents to reproduce their labor power or, better, high enough to ensure their loyalty. Other salaries will eventually judder in place accordingly (Höfgen, 2020, p. 105). Beyond getting the government's currency accepted, there are further functions taxes can support: They can be a tool in demand management, they can be used to battle inequality, or to influence expenditure or behavioral decisions; financing the government's budget is not among them (Bell, 2000; Höfgen, 2020, p. 121; Ruml, 1946).

This brings us to point three. Since all citizens need to pay taxes, and one can pay taxes only in the government's currency, money can be seen as tax receipt or tax credit. Note the double inversion in which MMT differs from the mainstream view: First, in the mainstream account, the government needs the taxpayers' money to "finance" its budget, while for MMT, the citizens need the government's currency to pay their taxes. Since the government is the currency issuer (creator of fiat money), it makes no sense to assume that it is after the tax payers' money. There is obviously something else it wants: It wants some of the people's resources, most importantly their labor! To put it simply: The government creates fiat money (by issuing money icons, e.g., notes, or simply keying numbers in authorized spreadsheets); imposing taxes in that currency incentivizes a maze of economic activities (e.g., producing commodities, providing services), which in turn underpin the fiat money with value. Second, while in the mainstream, account taxing precedes (government) spending and even sets the limit for its budget, in MMT, spending has to precede taxing (Kelton, 2020). Moreover, since the government as currency issuer faces no inherent limit in creating fiat money, it follows what one may call the "main theorem of MMT": "A sovereign government does not face any financial constraints. It always can buy anything on offer in its own currency" (Mitchell et al., 2019 p. 13). Obviously, this does only apply for governments which did not tie their currency to another country's currency or a commodity (e.g., gold) or which are indebted in a foreign currency. Hence, there is a spectrum of sovereignty. The USA enjoys high monetary sovereignty, the UK, Australia also, while Zimbabwe has little monetary sovereignty. Countries of the European Monetary Union (EMU) are sitting somewhere in the middle since they use a currency not controlled by a national government.

The MMT main theorem is accompanied by a corollary: that even sovereign governments face real resource constraints, i.e., constraints in labor, natural resources, or knowledge resources. But: "Anything what we actually can do we can afford" (Tooze, 2021, p. 22, quoting Keynes' 1942 BBC Address). The limit is not: "Can we afford it?" The limit lies in the actually available real resources. Spending into an economy, where all resources are already activated, leads to inflation. Involuntary unemployment, however, is a clear indicator of unused capacity.

Two dangers are usually invoked: the mounting public debt and the (alleged) likelihood of inflation. Inflation describes the process when average prices rise beyond average wages. MMT rejects the monetarist claims that inflation is driven by the expansion of money supply (cf. “quantity theory of money”) both on theoretical and empirical grounds. Instead, it sees a strong link between inflation and unit labor costs (Flassbeck et al., 2020, pp. 72, 94). Only increasing wages beyond the level of productivity increases under conditions of full employment leads to inflation. Central banks observing such developments usually can reduce demand from labor by increasing interest rates to manage inflation. The mounting of public debt leads us to the next section where sectoral analysis will throw a new light on what public debt means.

## Sector Analysis and the Mechanics of Balance Sheets

The government issues fiat money and spends it into the economy. Hence, the money in the nongovernment sector increases while the money in the government sector decreases. However, “money flow” is a metaphor too close to the traditional understanding of money as a thing, which “changes hands” or flows from one bucket to another. It is more appropriate to conceive the monetary system as a set of related balance sheets, in which claims accumulated in one balance are exactly mirrored by liabilities in someone else’s balance. In a closed economic system (and the world as a whole is a closed economic system), the net financial balance is at each point in time zero (so are the net financial liabilities) (Flassbeck et al., 2017, p. 4). It also shows that the world as a whole cannot “save” (acquire net financial assets) for the future: Wealth consists of net financial assets and tangible assets. Since the world’s net financial assets are always zero, the wealth of the world consists of its tangible assets (its capital stock). This shows how misguided austerity policies are from a macro-economic vantage point when it tries building financial wealth at the expense of the maintenance of the capital stock.

Godley’s “one equation model of the world” (Kelton, 2019, p. 105) states:

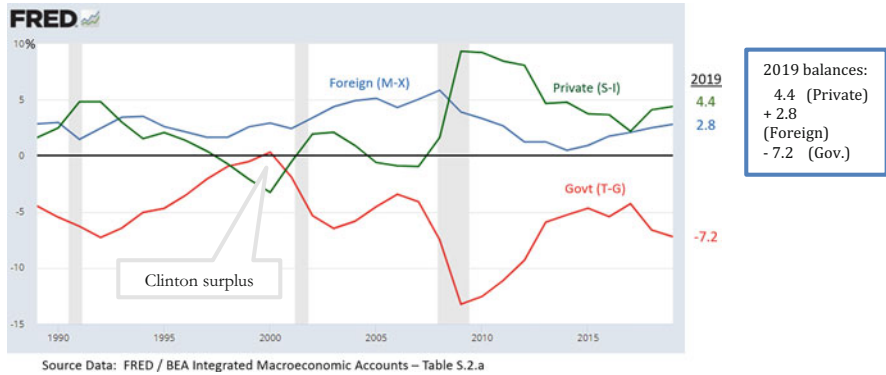

$$\text{Government financial balance} + \text{Nongovernment financial balance} = \text{Zero}$$

This means that a deficit in the government’s financial balance implies a surplus in the nongovernment sector’s financial balance.

Usually economists partition an economy in three sectors, the public sector, the private sector, and the foreign sector. If one ignores for a moment the foreign sector (it may be marginal or balanced), Godley’s equation would read:

$$\text{Government financial balance} + \text{Private sector financial balance} = \text{Zero}$$

This is equivalent to saying that the government’s deficit is equal to a surplus, the private sector surplus. This is a major MMT punchline: “Their red ink is our black ink” (Kelton, 2020, p. 101 ff) (Fig. 4).

**Fig. 4** Sectoral financial balances in US economy 1990–2017. (Note: The diagram illustrates how the **private sector financial balance** and the **government sector financial balance** mirror each other. By definition, the three balances must net to zero

During the Clinton administration (1993–2001), the government reduced the deficit (and even achieved a surplus). However, at the expense of a massive private sector deficit.)

Misled by the (wrong) analogy of the government’s balance and a household budget, it is widely preferred to have a surplus not only in the private sector but also in the public sector. This is, in principle, possible (for some countries) if the foreign sector balance (import minus export) is negative, i.e., exports exceed imports. Germany is a point in case. However, sector analysis shows that this is not a generalizable option: A surplus country requires a debtor country since the accounting system matches each surplus with a deficit, each credit with a debt. It is not possible to wipe out all debts (liabilities) without wiping out all credits (claims) at their same time. (Note that, in a “normal” market economy, businesses borrow to invest and pay back the credits out of the profits.) Since meanwhile the business sector balance sheets (in the USA or Germany) also show surpluses, the governments have to pick up the debtor role.

## Fiat Money

In a modern economy, we distinguish between two monetary circuits. The circuit of reserves connects the central bank with the commercial banks, while the circuit of money of account connects the commercial banks with their customers. Each bank has an account at the central bank, and each household or business has at least one account at a commercial bank.

The creation of fiat money is done on two levels: on the level of commercial banking through lending and on the government level through spending into the economy (deficit spending).

Until recently, commercial banks were seen as mere intermediaries, whose lending depended on what savers have deposited. Meanwhile, it is widely accepted that “loans create deposits” (McLeay et al., 2014; Werner, 2014). In the words of an economist of the European Central Bank (ECB): Money is created since the commercial bank pays with a claim against itself (liability). Such liabilities of commercial banks are counted as part of the money supply (Biswanger, 2012, p. 29). (If an apple farmer wants a credit, the bank simply keys a number into his account. The farmer, on the other hand, has to produce real apples and sell them to service the loan.) In reality, money creation is driven more by commercial lending than by central bank activities (Douglas & Raudla, 2020, p. 9). In principle, this creation of fiat money is a flexible way of providing the economy with the needed liquidity. If all works well, the money is used productively and incentivizes activities in the real economy rather than being used for speculation.

Money creation on the government level involves the central bank and the ministry of finance. MMT considers the central bank as being “owned” by the government and refers to the central bank and the ministry of finance as “consolidated government.” If the government needs money to spend into the economy, it advises the central bank to credit the account the reserves needed. The central bank does so while entering the same amount as liability in its own account. Say, the government wants to construct a harbor. Then the ministry of finance convenes a consortium of companies to do so. It advises the central bank to create the reserves necessary to equip the banks representing the consortium with the reserves necessary to enable them to credit the companies with the necessary money of account. In the end, the government gets the harbor, the companies get their profits, and the workers get their salaries. There is nothing here which has to be paid back . . . unless (for questionable reasons) the government is not allowed to run a deficit. MMT considers this as self-imposed constraint.

Generally, this forces the governments to sell bonds to the banking sector. Due to the deficit (!), the banking sector can do that and, since it involves simply swapping the reserves the banks keep at their central bank accounts with bonds (i.e., interest-bearing reserves), is very interested to do that.

As long as money creation (by commercial banks or the central bank) incentivizes productive activities in the real economy to realize the government’s democratic mandate, there is little danger of inflation. However, while governments can create money, they cannot control its use. Often it is not invested in the real economy but for the buyback of shares or in the FIRE sector (FIRE = Finance Insurance Real Estates) leading to a form of “nightmare MMT” where the expansion of the money supply is, via internal mechanisms of our economic arrangements, handed through to the billionaire class (Hudson et al., 2020b, April 10). To prevent that, monetary and fiscal policies have to be coordinated.

## **Normative Extensions**

MMT refers to itself as a descriptive theory. It claims to provide a superior description of the mechanisms of the monetary system in the USA (and nations of similar monetary

sovereignty) (S. T. Fullwiler, September 2010 (edited April 2011); E. Tymoigne, 2016; É. Tymoigne & Wray, 2013). This understanding provides MMT with a lens, which allows identifying additional policy space. Government spending is not constrained by tax revenues (or the selling of bonds), but by inflation signaling real resource constraints. This creates additional policy space. How this space is used poses normative decisions and cannot be deduced from the descriptive kernel of the theory.

MMT sees economics as “the study of creation and distribution of society’s resources” (Mitchell et al., 2019 p. 7). It is not seen as a natural science or a form of applied mathematics, the logic of which renders the negotiation of societal goals irrelevant. MMT researchers therefore explore the viability of their normative preferences in the light of the MMT framework. The first issue is unemployment, which they proposed to address by a general Job Guarantee (JG). The idea here is simple: While at present the economy operates with a buffer stock of unemployed people, the JG proposes to operate with a buffer stock of employed people. MMT proposes a centrally funded but locally administered “public service employment” (PSE) (Randall Wray & Kelton, 2018; Tcherneva, 2018). Another issue is the Green New Deal (GND) which relates to the climate crisis (Nersisyan & Randall, 2019). In relation to education, the issue of student debt cancellation has been explored (Fullwiler et al., 2018, p. 50). It was found that student debt cancellation would be feasible and, instead of being an unsustainable burden, would act as a positive economic stimulus (since it would free income to spend back into the economy). The impact on inflation was found to be negligible (Fullwiler et al., 2018, p. 50).

---

## Covid, Conclusions, and Caveats

Covid: This chapter is written under the conditions of covid-19. The pandemic led to major government interventions, some pertaining to the economy as a whole, others directly impacting education. Monetary sovereign governments were able to impose lockdowns, intentionally putting the economy in artificial coma, while keeping it on life support by launching massive stabilizing programs (Bibow, 2020).

With respect to education, the pandemic-imposed “social distancing” should have provided a through pass for “distance education.” And in higher education, DE worked reasonably well; since universities were reasonably digitally connected, students usually owned the necessary mobile devices and were competent in operating them (Dolch et al., 2021). In schools, the pandemic-induced precipitated shift to DE (referred to as Emergency Remote Teaching (ERT) (Hodges et al., 2020)) worked less well. Due to the varying quality of the Internet infrastructure, basic preconditions for online teaching were not in place. Pupils did not own the necessary end devices, nor had they easy access to them. What they had varied according to the socioeconomic status of the family. Teachers have to deal with devices of varying quality, often lacking interoperability. Both problems show that ERT was facing problems beyond the reach of individual institutions.

Conclusion: The first part of this chapter sketched the costs and economics of DE. Costing is part of microeconomics. MMT, as a macroeconomic discipline, has

little to add here. The insights in the cost-efficiency of DE remain valid. Financing education is part of macroeconomics. It is here that MMT makes a difference. When discussing financing, distance educators find it necessary to call for redistributive taxation (e.g., Rumble, 2007) or want to bring in private capital (e.g., Daniel et al., 2006). MMT tells us that monetary sovereign governments do not have to rely on taxes for financing their goals as long as it has the required resources. Money is debt and is created either as private or public debt. In the first case, it is created through commercial lending, in the second case as government “debt.” The change of macroeconomic weather conditions (cf. HCT 2) gave preference to private rather than public debt. Understanding sectoral analysis changes the perception of public debt (cf. Kelton’s “their red ink is our black ink”). It is less intimidating than private debt, since the (consolidated) government is in a much different debtor position than an individual. Moreover, MMT identifies policy space, beyond tax income and below the inflation threshold, where some policy agenda can be realized: free (or subsidized) education, health, and infrastructure. It can be used for implementing the initial mission of DE: to widen access to education, including HE, beyond its traditional audience. In contrast, under the neoliberal preference for commercial lending (private debt), the real economy of production and consumption is surrounded by a tightening network of tollbooths where surplus is siphoned off in form of interests and rents to the FIRE sector. The dynamics of compound interest threatens “killing the host,” i.e., the real economy (Hudson, 2015, 2017). Student debt is one of such tollbooths.

Hence, MMT shows that it is possible to widen access to education (including HE) without devolving the costs to students, nudging them toward debt peonage. This allows DE to relax its efficiency drive and build in more resilience in the its system, sadly missed in times of emergency.

Caveats. First, MMT is based on the notion of monetary sovereignty. Not only is there a spectrum, but also a hierarchy of monetary sovereignty with the US\$ in a position of dominance. This limits what can be transferred. Nevertheless, understanding modern money systems takes some of the TINA sting out of the “there is no money” austerity mantra. Second, the MMT insistence that taxes only serve to ensure the currency acceptance underplays their importance in preventing state capture (e.g., regulatory capture). Quantitative Easing illustrates that spending money into the economy does not prevent it ending in the coffers of the 1% (Hudson et al., 2020a). Third, admittedly this presentation of MMT lives not up to the depth and the scope the discussion of the topic merits. For more, the reader is referred to (“Modern monetary theory and its critics,” 2019, October, 11). The more mathematically inclined may download the (free) Minsky software and view S. Keen’s tutorials on how to use it to explore some MMT aspects (<https://www.youtube.com/watch?v=Dt4thL3eToU>).

## Abstract

Globally, partnerships and collaborations are increasingly common in post-secondary education. The advent of networked technologies has intensified bilateral and multilateral engagements, and in the context of learning, it reveals there are a variety of partnership and collaboration “types” that can form. This chapter presents three examples of partnership and collaboration types drawn from the academic and business literature. Four case studies of partnerships and collaborations are then presented, and the aforementioned types are applied as a best fit to a given case study. The exercise illustrates how partnerships and

collaborations in postsecondary education may develop and evolve, and how they can be sustained. The partnership and collaboration types offer some structure to better understand how institutions may approach and derive benefit from engagement with other institutions centered on achieving the objectives of access, quality, and innovation, espoused by proponents of online learning.

## Introduction

University and college systems, as well as governmental, parastatal, and inter-governmental organizations, are undertaking large and small-scale projects to implement online learning through partnerships, alliances, or collaborative ventures with increasing frequency. The objective is often focused on a common educational activity, leveraging each partner's comparative advantage, and pooling resources to achieve a common goal in the form of curriculum reform, technological application, and programmatic diversity. In many cases, stakeholders work together to support corresponding policy goals usually informed by economic priorities.

In this chapter, we focus on partnerships that are centered on widening access to quality learning and realized through the application of information and communications technologies (ICT). In these contexts, academic, social, or workplace development needs frequently motivated partners to engage in such collaborative initiatives, with the impetus arising from systemic pressures to:

- More fully utilize public education opportunities
- Provide increased access to higher education, adult education, and lifelong learning opportunities for underserved populations
- Increase learner mobility, upskilling, or reskilling for dynamic employment environments

While the long-term success of such ventures is largely unproven, and their downstream sustainability remains terrain to be explored, there is continuing evidence of governmental support for collaborative initiatives that broaden access to education. The examples provided in this chapter will describe and discuss research and practice specific to collaborations and partnerships in education and delivered through ICT applications. We use the following topics to provide background for discussion.

- The nature of collaborations and partnerships: **propositional** (Cardell, 2003), **cooperative** (Todeva & Knoke, 2005), **mutual service alliances** (Eckel & Hartley, 2008), and others that may be extant in the academic or business realms.

- Discussion of partnerships, collaborations, and alliances in the Global South and Global North and their relationship to strategic success factors with short case studies drawn from the following entities:
  - Commonwealth of Learning: Regional Centres (Sub-Saharan Africa, Asia, Mediterranean, and South Pacific) (Perris & McGreal, 2021)
  - Partnership for Enhanced and Blended Learning (PEBL) in East African universities (UK Aid, 2021)
  - BCcampus (2012, 2014)
  - eCampusOntario (Higher Education Quality Council of Ontario, 2020)
- Discussion and focus on factors that promote sustainability or facilitate strategic “pivots” to account for emergent issues or new priorities of institutions and governments that can be served effectively by collaborations or partnerships

To delineate on the case study examples presented in this chapter, we offer a brief overview of several types of partnerships in the literature and then apply them to the aforementioned entities to deepen understanding on how partnerships may form, demonstrate value, and can be sustained.

---

## Types of Partnerships and Collaborations

### Propositional Collaborations

When a collaboration or partnership is developed to capitalize on perceived opportunities that are not yet proven, the term used by Cardell (2003) is “propositional.” That is, there is a set of factors in the context of proposed partner operations that is seen to align to offer new possibilities of interest to each stakeholder. An example in higher education is the branch campus, defined as an institution, usually from a country in the Global North, setting up a campus in a country in the Global South. For the institution, it enhances its international footprint, enables faculty exchanges and networking, and provides an additional revenue stream. For the hosting country, the branch campus addresses and fulfills unmet demand for higher learning, provides quality education that is usually recognized domestically, and enables local faculty to gain international experience in the home context. In this example, though not necessarily exclusive to propositional collaborations, the goals of each entity are not necessarily aligned but are complementary.

### Cooperative

The cooperative approach implies a level of commitment by individual participants through an equal stake in the governance of the partnership and established processes for membership, participation, and the setting and amending of the rules of engagement. It is considered a democratic model of collaboration. Unlike the example of a branch campus as a propositional collaboration where roles and

goals are largely distinct, a cooperative approach reflects the need to innovate toward a product in which both, or all entities may benefit, and all stakeholders participate in a democratic decision-making process to ensure outcomes are truly congruent with the majority's needs.

## **Mutual Service Alliances**

Mutual service alliances require the least amount of commitment from the collaboration. This type of partnership can be characterized as participants engaged in an arrangement that provides content, service, and support at a lower cost or with lower overhead than what might be expected participating in the same service as a singular entity. One example might be the development of a policy brief by a hosting organization that would provide value to a receiving organization. Another might be a shared service where multiple organizations share the cost of an online application by aggregating participants among institutions to lower the cost of service for all. Mutual service alliances are becoming a common way to arrange for cost-effective services to meet a community need.

---

## **Examples of Collaborations and Partnerships in Practice: Formation, Value, and Sustainability**

In this section, four case studies are presented, drawn from Canadian and transnational arrangements. The aforementioned partnership and collaboration types will be aligned to a given case study to illustrate how partnerships and collaborations in postsecondary education may develop and evolve, and how they can be sustained.

## **Commonwealth of Learning: Regional Centres**

Established in 1987, the Commonwealth of Learning (COL) is an intergovernmental organization located in Metro Vancouver, Canada. COL's mandate is to engage in capacity building (e.g., workshops), advocacy (e.g., thought leadership), networking (e.g., holding and attending events), and partnerships.

**Profile** The 54 member states of the Commonwealth are clustered in Sub-Saharan Africa (19 member states), Asia (8), the Caribbean and Americas (13), Europe (3), and the Pacific (11) (see Fig. 1). Of the 2.4 billion inhabitants, 60% are under the age of 30, as compared to the OECD, for example, where the median age is over 40. India is home to the largest population of Commonwealth citizens at 1.35 billion, and Nauru is home to the smallest by population at nearly 10,000. Economically, GDP per capita ranges from USD 97,000 in Singapore, the richest, to USD 1,000 in Malawi, the poorest. More than half of the member states, at 31 countries, are

Countries by region

**Fig. 1** Member states of the Commonwealth

categorized as small states, loosely defined as having approximately 2 million inhabitants or fewer. Amid this immense diversity, there are several binding elements shared by Commonwealth member states, including a commitment to democracy and to human rights.

To enable its operations, COL relies on a vast network of partners throughout the Commonwealth. Long-term partnerships with member states are essential, and this is largely manifested through key country appointments. Otherwise referred to as Focal Points, these appointees are staffed in government or educational institutions (usually universities) and act as liaisons between their home country and COL. Among a range of roles, Focal Points field requests from COL for annual country contributions, inform COL of strategic directions and learning needs in their country, and can identify new institutional partners for COL. The focal point is a voluntary role and carries a degree of transience. Consequently, the level of engagement from Focal Points varies.

Another important partnership to COL is its Regional Centres. There are four Regional Centres, strategically located in several geographical regions, and they are outlined below.

### **Regional Training and Research Institute for Distance and Open Learning (RETRIDOL)**

The first Regional Centre, established in 2003, was the Regional Training and Research Institute for Distance and Open Learning (RETRIDOL). It is located at the National Open University of Nigeria, located in Abuja, the country's capital city. RETRIDOL responds to the ODL needs of the five Commonwealth States in West Africa. RETRIDOL is focused on training, networking, and research (Eya, Shaibu, & Amini, 2019). It has several main projects, which focus on tertiary

education to develop ODL capacity and ultimately acquire accreditation from their national higher education governing bodies. RETRIDOL is also engaged with ongoing collaborations with the Economic Community of West African States, which includes 15 member states from the region.

**Southern African Development Community Center for Distance Education** Geo-politically, Southern Africa is supported by the Southern African Development Community (SADC), comprised of 16 member states. The COL Regional Centre in the SADC region takes its name from this organization, as it is entitled, the SADC Centre for Distance Education, or SADC-CDE. SADC-CDE is housed at Botswana Open University, which, like SADC, is in the capital city of Gaborone. SADC-CDE was jointly established by its hosting university and the Ministry of Education and Skills Development<sup>1</sup>. SADC-CDE has a large geographical remit that includes 11 Commonwealth States. Its projects mainly focus on building capacity for technology-enabled learning in secondary or open schooling institutions.

**Pacific Centre for Flexible and Open Learning for Development** The Pacific Centre for Flexible and Open Learning for Development, or PACFOLD, is COL's Regional Centre in the Pacific. Established in 2013, it is housed at the University of the South Pacific, a regional university with 13 campuses located throughout the South Pacific. Like its Open University counterparts in Nigeria and Botswana, the University of the South Pacific has a focus on open and distance learning, though it has not adopted an ODL moniker. PACFOLD's remit is the nine Pacific Island Countries that are also members of the Commonwealth. The work of PACFOLD is focused on developing skills and employability. It is engaged in several projects having recently been coawarded a grant from New Zealand's Ministry of Foreign Affairs and Trade. Projects are largely focused on youth and youth workers (Commonwealth of Learning, 2019), out-of-school-children (Narayan, Naidu, Mays, & Perris, 2021), and teacher education (Mays, Ogange, Naidu, & Perris, 2021).

**Commonwealth Centre for Connected Learning Foundation** The newest COL Regional Centre is the Commonwealth Centre for Connected Learning Foundation, or 3CL Foundation. It was established in 2017. The 3CL Foundation is in Valletta, Malta, and is supported by the Ministry of Foreign Affairs. The 3CL Foundation has a unique remit, as compared to the other Regional Centres. Situated in the southern Mediterranean, it serves as a linkage to COL with the European Union and includes the United Kingdom and Cyprus as its Commonwealth counterparts in the region. As these are high-income countries, COL and 3CL Foundation focus their work elsewhere, and mainly in Sub-Saharan Africa, and pan-Commonwealth. Its projects are

---

<sup>1</sup>The Ministry has been reconfigured and split into two: Ministry of Basic Education and Ministry of Tertiary Education, Research, Science and Technology. The Ministry of Basic Education is aligned to SADC-CDE.

focused on imparting innovations in postsecondary education such as in digital literacy, and blockchain in education.

**Formation and Context of the Partnership** COL and its Regional Centres demonstrate the effectiveness of a regional service alliance. Both entities are dedicated to the advancement of open and distance learning and focus these efforts in low- and middle-income countries. Funding is a shared endeavor. COL provides annual operating budgets, and a dedicated staff member to support project implementation, and the hosting organization of a Regional Centre provides staffing, space, and equipment. In reverting to the understanding of a mutual service alliance, the synergies are quite clear – COL has a mandate to support its member states and relies on the Regional Centres to carry out COL’s work by leveraging local networks and delivering or codelivering workshops, and related activities. The Regional Centres rely on COL for funding, strategic direction, and technical expertise. For either entity to engage in such work independently, the yield of outcomes and impact would be significantly curtailed. Contractually, there is usually a three-year agreement signed between COL and a Regional Centre, but funding is in one-year instalments.

Where COL is focused on the pan-Commonwealth, the Regional Centres are more localized. To date, there have been few multilateral or other bilateral arrangements between the Regional Centres, and it will likely remain the responsibility of COL to foster interactions between its Regional Centres.

## **The Partnership for Enhanced and Blended Learning**

The Partnership for Enhanced and Blended Learning (PEBL) project was aimed at enhancing the quality, development, and delivery of blended learning modules<sup>2</sup> among a collection of universities located in four East African states that were also members of the Commonwealth. The four countries included Kenya, Rwanda, Tanzania, and Uganda. The project was run over 5 years, from 2017 to 2021.

The project was formed by four technical partners including the Commonwealth of Learning and three UK-based organizations: the Association of Commonwealth Universities, or ACU, the University of Edinburgh, and the Staff Educational Development Association. The project was funded by the Department for International Development of the United Kingdom under the Strategic Partnerships for Higher Education Innovation and Reform initiative. The ACU was the lead organization responsible for disbursement of funds to the technical partners and liaised with the funder.

---

<sup>2</sup>The term module refers to a particular unit within a discipline, which is referred to as a course, in other contexts. In this case, several courses, or modules, will comprise a credential.

The project was a response to the immense growth in participation rates in higher education in the region (Young et al., 2021). To ameliorate a shortage in subject matter expertise, the project was designed to develop and share quality-assured blended learning modules across institutional and national boundaries, a distinctive feature given the challenges of accreditation and transfer in the region (Trines, 2018).

Nontechnical partners included Kenya's Commission for University Education, and 23 universities engaged in module development and module sharing located in the aforementioned four African states.

To enable the development and utilization of modules, all universities were to designate individuals who would be eligible to participate in pedagogical and quality assurance capacity-building activities. COL was designated as the quality assurance lead. It carried out its role in two ways. First, COL developed a rubric to quality assure the modules against a series of benchmarks codesigned with technical and nontechnical partners (Perris & Mohee, 2020). Second, COL developed a self-audit tool for universities to assess their status with blended learning, identify gaps (e.g., professional development, physical infrastructure), and develop a corresponding improvement plan (Mohee & Perris, 2021). Like other technical partners, COL conducted in-person and online workshops, along with digital correspondence (email and text messaging) to build rapport with participants, provide support, and share materials.

Modules were developed for undergraduate- and master-level programs and covered a range of disciplines. In total, there were 22 modules developed. They are located as free downloadable files, as Word files, or as Moodle backups, at OER Africa: <https://www.oerafrica.org/partnership-enhanced-and-blended-learning-pebl>.

The comparative advantage of a given institution was in its capacity to design quality-blended learning modules in a particular discipline that could be openly shared with another institution lacking comparable capacity in a given discipline. Overall, the project carried the following aims:

1. Improved network of universities for sharing degree-level blended learning courses
2. Strengthened and increased use of regional (OER Africa) and individual learning management systems (LMSs)
3. Increased capacity of universities to support pedagogical approaches for blended learning
4. Strengthened quality assurance systems for blended learning courses
5. High-quality, credit-bearing blended learning courses included in university programs

**Formation of the Partnerships** The PEBL project was comprised of multiple partners, located across seven countries and three continents. On the surface, the technical partners were the *purveyors of knowledge*, and the nontechnical partners were the *recipients of knowledge*. Each technical partner brought a niche area of expertise in pedagogy, quality assurance, technology, or project management that

contributed to the project's aims. Each nontechnical partner brought a foundation, or interest in blended learning, along with subject-matter expertise.

Among the technical partners, the formation of the partnership was an *ad hoc* bilateral arrangement between the ACU and each technical partner. COL, for example, only engaged with the other technical partners during annual in-person meeting and workshops. Though it was no fault of any technical partner – there were no restrictions to engage with any technical or nontechnical partner – this presented some challenges as the flow of information and decision-making was largely controlled by the ACU. The nature of the partnerships varied; between technical partners, it was deemed more of a cooperative approach. All technical partners had an equal stake in the governance of the partnership, exemplified as membership in decision-making bodies that included the Steering Committee and Module Development Fund Committee. The partnership with the ACU and the other technical partners, however, was not fully equal. As the liaison with the UK government (funder), ACU was privy to more details and was the ultimate decision-maker in the project.

Like the case study of COL and the Regional Centres, the arrangement in PEBL between technical and nontechnical partners can be best described as a mutual service alliance. The universities in the PEBL project were recipients of funds to produce an outcome(s). In this case, it was to build capacity of staff to deliver blended learning modules, and for some of the institutions, there was the added outcome to develop modules. A small proportion of individuals from the universities participated in governance structures, but by and large, there was little room for nontechnical partners to contribute to decision-making. Technical partners relied on the universities which held the subject-matter expertise, institutional knowledge, and understanding of the sociopolitical contexts of their institution and their constituents. Without their presence, no outcomes could be generated.

In alignment with the main deliverables on quality assurance, COL developed two tools, informed by inputs from technical and nontechnical partners, to support the development of modules, and to develop institutions' capabilities to delivery-blended learning of good quality.

Most institutions which used the tools wrote reports to reflect learning and progress with a module and/or the institutional self-review. The creation of the tools was enabled by inputs from all partners, which occurred in person and virtually from 2018 to 2019. Technical and nontechnical partners piloted or offered inputs to the first version of the Rubric applied to the first six modules. It was then revised, independently reviewed, and published carrying a CC BY-SA 4.0 license. The subsequent 16 modules were quality assured using the published Rubric document.

The other tool COL developed was the Institutional Quality Assurance Review Tool, which was designed for institutions to carry out a self-audit to identify the status, gaps and means of improvement to deliver quality-blended learning. Like the Rubric, the QA Review Tool was benchmarked against a set of criteria codesigned by COL and other PEBL partners. Each institution's implementation of the QA

Review Tool included an online survey and follow-up on-site review that entailed planning, collecting, and analyzing data (e.g., interview, document analysis) to corroborate and expand upon findings from the online survey. The culminating activity was a report that outlined the findings and an improvement plan. The QA Review Tool was published under a CC BY-SA 4.0 license. Of the 23 universities in the PEBL project, 20 submitted the report at the time of writing this chapter.

By most accounts, including the findings from an external monitoring and evaluation exercise for the PEBL project (Young et al., 2021), the QA outcome reiterated here, “Strengthened quality assurance systems for blended learning courses,” was achieved. Institutions adopted some of the tools as a matter of policy, including the Open University of Tanzania and Makerere University (Uganda). Discussions have begun with Kenya’s Commission for University Education to consider a national policy on blended learning with focus on quality assurance, and there is potential to broaden such engagements with commissions in Rwanda, Tanzania, and Uganda.

The sustainability of the activities and partnerships forged in the PEBL project remain. In the middle of the PEBL project, the Covid-19 pandemic caused nationwide lockdowns in the four East African countries where the project was focused. To an extent, this was a blessing in disguise as it accelerated the adoption of digital learning. With limitations on in-person gatherings persisting, the importance of imparting flexible learning options in a blended format will likely persist. Without the technical and financial support enabled from PEBL, questions loom on how far progress will continue. One promising development is that COL has started independent work with three universities to expand on some of the capacity-building activities from PEBL.

## **Leveraging Resources Through Partnerships Within University and College Systems**

Universities and colleges across Canada, and indeed globally, have initiated large and small-scale projects to implement online learning consortia with the objective of participating in a common activity or pooling their resources for achieving a common goal. Once equipped with the needed ICTs, they form these alliances to bring postsecondary educational opportunities directly to learners. Various academic, social, or workplace development needs motivate such consortia initiatives. The impetus for the initiatives has come from systemic pressures to utilize public education opportunities more purposefully, to provide increased access to higher education for underserved populations, or to increase learner mobility in competitive employment environments.

Governments, funding agencies, and institutions strive to understand and control some of the factors that affect the success of large-scale consortia projects in which they invest to give propositional collaborations a stable platform on which to build and grow. Examples from two provinces in Canada, British Columbia and Ontario, are described to highlight the value propositions of these collaborative ventures and to discuss the requirements toward their sustainability.

**BCcampus** Over 19 years, BCcampus has moved from a propositional venture to an operational entity, providing research, services, and support for the 25 public higher education institutions in British Columbia. BCcampus is a government-initiated collaborative venture carrying the aim to network these institutions in a manner that allows learners to find and engage in online learning opportunities. The BCcampus concept was designed to benefit students by providing them with a set of online services that promoted access, choice, flexibility, and mobility.

In strategic collaboration terms, BCcampus began as a propositional collaboration, a visionary approach to an organizational or business need (academic services in this case) based upon the need to enhance research, instructional delivery, and student services to the parties involved. A primary mandate was to enhance students' ability to identify, choose, register for, and take courses from any of 25 institutions in the province. BCcampus also enabled students to apply any academic credits earned within the system against credentials from a selected (home) institution. While providing students with measurable value – namely, online course spaces available from all institutions – the collaboration was also intended to benefit institutions through the rationalization of demand for academic opportunities from students. This was realized through the supply of all online courses available, and the system attempted to mitigate duplications of service for maximum efficiencies within this large academic ecosystem.

Leveraging resources through partnership is not a new concept for academic institutions, particularly in areas where they do not compete or where the aggregation of resources effectively lowers costs for all as outlined from the following two examples in British Columbia:

- BCNet: An arrangement between universities and government to operate a high-speed research network.
- BC Council on Admission and Transfer (BCCAT): Using its Education Planner Website, it provided parents and students an information resource about the details of program requirements and transfer regulations across the BC higher education system.

These instances, however, did not pose an existential threat to a participating institution. Where “brand” played an important role – such as in the recruitment, admission, and registration of highly qualified students – partnerships and strategic collaborations were typically more difficult to develop and sustain. And, because propositional collaborations are based upon visionary goals rather than fully identified need, their development and nurturing required a more sophisticated approach to mitigate risk and to underscore the importance of cultural fit. In such cases, the prerequisite is the same for both active participation and persistence: the identification of resonant value from the perspective of each institution. For example, BCcampus needed to ask: *Which critical need for College X might be met by one or more of the many benefits that BCcampus brought to students, educators, and the postsecondary system?* The type and extent of this need fulfillment was the value proposition for individual institutions.

BCcampus explored the power of resonant value during its early years when the consortium administered the awarding of grants for reusable online resource development, funded by the provincial Online Program Development Fund. On bringing the successful grant proponents into a community of practice, BCcampus surfaced their concerns around copyright and reuse. A disconnect became apparent between the tools available in the proposed Creative Commons licensing scheme for open educational resources (OER) and the requirement by some institutions and faculty members for more tightly controlled copyright and licensing of creative works. This concern exposed a crack in the collaborative venture and the government-sponsored funding programs associated with it. The norm in the beginning was to preserve an institution's competitive advantage in its marketing of programs and courses. To fulfill this essential requirement, a hack of the Creative Commons license, the BC Commons license was designed. Its resonant value was to ensure that reuse was preserved within the province, but that marketing and sale of courseware could remain an exclusive revenue stream when institutions marketed learning resources and programs outside of the province. This decision was a double-edge sword, which deviated from an ideal of Creative Commons licensing that later in its lifecycle had to be revisited, readvocated, and reestablished by BCcampus. Fortunately, with lower costs, standards-based service levels, and predictable dates for upgrades, the approach taken by BCcampus was an overwhelming success.

Even within a network of collaborative ventures where partner entities have clearly defined roles, there is a possibility for service overlaps or even service confusion in the context of changing technologies and organizational capabilities.

In the case of BCcampus and BCNet, each provided different versions of shared services to academic institutions with the goal of reducing cost and enhancing a consistent service and maintenance for key services such as LMSs and other academic technologies. By 2012, BCcampus had multiple shared services as described in Fig. 2.

What sometimes became a confusing approach to shared services for institutional partners, and conveyed the appearance of competition between services providers, was resolved by specialization (or comparative advantage) using organizational strengths.

BCcampus had a strong pedagogical approach to defining service needs, and BCNET had a strong technical orientation to structuring and managing online services. In 2014, the leadership of both organizations structured and signed a memorandum of understanding to define roles that complemented the strengths of each organization as illustrated in the role descriptions in Table 1. Each partner committed to executing its role in an optimal fashion.

Since 2014, BCcampus and its partners have been providing services to the province's 25 postsecondary institutions. BCcampus has specialized as a leader in the development, adaptation, review, and distribution of open educational resources. It has also served as a leader in providing services to support emergent academic needs. Equity, diversity and inclusion programs, the facilitation of online teaching and learning, and supporting training for universal design for learning are some examples.

**Fig. 2** BCcampus shared service offerings 2011–2012 (BCcampus, 2012)

**Table 1** Shared service role structures for BCcampus and BCNET as outlined in a 2014 memorandum of understanding (BCcampus, 2014)

BCcampus role (application)	BCNET role (infrastructure)
<ul style="list-style-type: none"> <li>• At the request of participating institutions, BC government departments, or based on an environmental scan, BCcampus will research, evaluate, and implement pilot instances of educational technologies and applications to a maturity phase:                             <ul style="list-style-type: none"> <li>• Research innovative educational technologies for adoption</li> <li>• Coordinate and develop communities of practice for evaluation and pilot implementation of the technologies</li> <li>• Implement and support technologies and applications, and establish interim governance through the pilot phase</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• With support of its institutional members, BCNET will operate mature shared educational technology services:                             <ul style="list-style-type: none"> <li>• Provide core IT infrastructure (hosting, storage, and networks) as the basis for such services</li> <li>• Procure and manage software licenses and third-party services needed for the deployment and growth of educational technologies</li> <li>• Create and manage contractual agreements with members for services</li> <li>• Act as the signatory for various contractual agreements with suppliers</li> </ul> </li> </ul>
<b>Joint roles</b>	
<ul style="list-style-type: none"> <li>• Transition of educational technologies and applications from pilot to operational phases, facilitated through collaborative IT and educational technology / teaching and learning working groups (e.g., Collaborative Technologies Working Group, LMS Working Group, and others as required)</li> <li>• Collaborative development of a roadmap for shared educational technology services</li> </ul>	

BCcampus is funded by government primarily and, as such, is largely seen as a public service in British Columbia's higher education sector demonstrating a collaborative approach to support institutional needs. In collaborative ventures which begin as propositional initiatives, a key strategy is incremental adjustment to continuously provide resonant value for client institutions and partners in federated service roles.

In 2013, the government of Ontario, Canada's largest province, made the decision to follow the model provided by BCcampus and initiate its own collaborative venture among the province's 45 public colleges and universities. The government of Ontario called its collaborative proposition eCampusOntario and began the development of the entity in earnest in 2014.

**eCampusOntario** In 2014, the Ontario government committed \$72 million over 5 years to support the development of eCampusOntario, and the provision of high-quality online learning experiences for Ontario's postsecondary students. It established eCampusOntario as a nonprofit corporation positioned between government and its members: the province's 45 public colleges and universities. Its revenues were provided by government, and the broad range of functions eCampusOntario was mandated to provide was rooted in a rapidly evolving series of transfer payment agreements between eCampusOntario and the provincial government.

eCampusOntario initiated the process to build its first strategic plan in late Fall of 2015. It embraced the following six targeted services: Quality (in courses and programs), Innovation, Collaboration, Research, Accountability, and Relevance.

The Ministry funded the creation of eCampusOntario with the ambition to push system improvements through collaboration and innovation and build Ontario's global reputation as a recognized leader in online and technology-enabled education. Unlike the original BCcampus model which initially supported access to online courses and course registration and transfer support, the eCampusOntario model had a much more focused mandate, aimed specifically at the pedagogical aspects of supporting technology-enabled learning. Its mandate, as outlined in its strategic plan, broadly described the trajectory for the organization at the 45 members institutions:

- Support the development and delivery of quality online learning experiences
- Lead in research, development, and sharing of best practices in online and other forms of technology-enabled learning
- Support member institutions in fostering innovation, collaboration, and excellence on behalf of Ontario students
- Contribute to the evolution of teaching and learning by:
  - Anticipating and responding to new and emerging technologies
  - Leveraging existing strengths in Ontario's postsecondary system
  - Developing new capacity
  - Supporting the development of state-of-the-art fully online courses and programs

The mission was clear and bold and, with a highly competitive edge, intended to position Ontario as a learning technology leader in Canada and globally. eCampusOntario was to work with member institutions “to promote accessibility, collaboration and innovation in online and technology-enabled learning that will enhance learner experience, support faculty development and extend Ontario’s global reach,” and become “a centre of excellence and a global leader in the evolution of teaching and learning through technology” (eCampusOntario, n.d.).

From 2016 to 2018, eCampusOntario operated under its initial strategic plan that also had as a primary duty the distribution of competitive grant funding to institutions to address the items from the strategic agenda that would be undertaken by institutions themselves. The bulk of the funds flowed to institutions as requested by government, divided equally between the college and university sectors in agreement with Colleges Ontario and the Council of Ontario Universities, the two sector councils representing academic institutions with government.

In 2016, a chief executive officer was hired to lead subsequent steps in moving the eCampusOntario development process forward, including a renewed focus on collaboration guided by an updated strategic plan for the 2017–2021 time span. The strategic priority of government at the time was to also build on work by BCcampus to create a digital library of open textbooks and other teaching resources that would be freely available to Ontario faculty and students. eCampusOntario responded by launching an OER development fund and the creation of a digital library with search tools, submission, and review (tools) to ensure a quality-informed process was used to build a collection of free and reusable academic resources. By 2021, eCampusOntario had reported over USD \$10 million in savings using open textbooks by students and the subsequent savings to students through the availability of free learning resources. In British Columbia, where BCcampus has been established since 2003 and its open library since 2012, they reported savings of USD \$16 million by October 2020 (BCcampus, 2020).

eCampusOntario continued rounding out its portfolio of service offerings to institutions and faculty through the 2016–2019 period. Notable additions to its service offerings mirrored expressed needs from institution, faculty, and government and included the following key programs:

- LearnOnline portal: A directory of online courses offered by all 45 member institutions, and transfer requirements, and noted whether a course used an open textbook as its primary resource <https://learnonline.ecampusontario.ca>
- The Ontario Open Library: A directory of downloadable open textbooks and resources that could also be integrated with websites and LMSs <https://openlibrary.ecampusontario.ca>
- Micro-credential Portal: Funding and support for institutions and employers to create short-form, assessed, competency-learning experiences to upskill and reskill learners to enhance employability <https://micro.ecampusontario.ca>
- Extend: A microcredentialed professional learning program comprised of six modules and a capstone project to upskill educators for online teaching (see <https://extend.ecampusontario.ca>)

- Student Experience Design Lab (SXDLab): Focused on bringing together students to create new forms of experiential learning (see <https://sxdlab.ecampusontario.ca>)

As often happens with government-funded propositional collaborations, a change in government can affect policy and priorities. A new government, elected to office in 2018, decided to review its digital education agencies and commissioned a study of eCampusOntario. It reported that eCampusOntario had a consistent focus on:

- Coordinated course delivery across multiple institutions for credit
- The generation of best practices, research, and data on technology-enabled learning
- Interinstitutional collaboration on tools, services, and technologies to create a suite of supports for online learners and their instructors

However, the report noted that it was difficult to ascertain whether government had a higher-level strategy and expectation for digital learning that included other digital agencies that it supported, and whether each, including eCampusOntario, was having the impact at a level government should expect. As the report highlighted,

eCampusOntario serves two masters — the government that funds it and the institutions that represent its shareholders. Given the makeup of its governing board, it is perhaps not too surprising that a nontrivial amount of its funding goes directly to institutions to promote the digital-learning developments and activities they desire. The fundamental question is whether these activities of eCampusOntario are consistent with the desires and inclinations of its funder, the government, or whether the government would like to see some of this funding directed to other provincial digital-learning priorities and goals. The answer to this question demands clarity from government and, subsequently, clear direction to eCampusOntario from government. (Higher Education Quality Council of Ontario, 2020)

Subsequently, the government of Ontario has continued to fund eCampusOntario and has established a Virtual Learning Strategy centered on a new USD \$40 million investment that is intended to drive growth and advancement in virtual learning across the province's postsecondary institutions. The strategy will expand the possibilities of traditional and lifelong learning through the accelerated use of both online and hybrid learning <https://vls.ecampusontario.ca>.

---

## Factors That Promote Sustainability or Facilitate Strategic Pivots in Effective Collaborations or Partnerships

In this chapter, we set out to identify forms of partnerships and collaborations present in four case studies premised on advancing access to quality learning through the application of ICTs. The collaborations and partnership types included **propositional collaborations**, **cooperative**, and **mutual service alliances**.

### International Case Studies

In the internationally oriented case studies – the COL Regional Centres and PEBL – we identified cooperative and mutual service alliances as commonly represented. The arrangement between the four technical partners in the PEBL project was most closely aligned to **cooperative**. Governance structures and procedures were subject to deliberation by all technical partners. The Association of Commonwealth Universities, however, was the ultimate decision-maker. This outcome illuminates important contours to the types of collaborations and partnerships discussed in this chapter. Partnerships should be assumed to be complex arrangements. Institutional histories, individual personalities, and varied interests are oftentimes tacitly expressed and can never be completely understood by another party. In PEBL, the arrangement between technical partners, albeit cooperative, was nuanced and fluid. Readers should therefore view these types as existing on a continuum and consider the idiosyncrasies – which are also not fixed – in a partnership to understand the arrangements, contributions, and roles of each stakeholder.

As a **mutual service alliance**, the services provided by the PEBL technical partners enabled cost savings for the 23 recipient universities. The quality assurance outputs, to which COL was responsible, were reliant on inputs and piloting of tools by the 23 partner institutions. Their contributions were mainly in-kind and in the form of professional time and absorbing incidental costs.

It is noteworthy that COL initiated efforts to deepen the relationship with three of the universities in East Africa. COL's invitation to partner on different initiatives tangentially related to PEBL is an example of emergent or new priorities deemed of mutual benefit in relation to capacity building in technology-enabled learning. These new arrangements, which will continue as mutual service alliances, point to a degree of maturation between parties and reinforce the fluidity of partnerships. The interests that bring together partners may be based on a vision or an idea, akin to a propositional arrangement, rather than a specific project. These new mutually beneficial opportunities have deepened the partnership between COL and some of the other partners and bode well for their sustainability.

In the context of the COL Regional Centres arrangement, this was also identified as a mutual service alliance. Like the PEBL project, the partners from the Regional Centres are able to acquire cost-savings for their constituents based on COL's financial contributions and technical inputs. COL, in turn, strengthens its footprint and reaches a wider swathe of institutions across the Commonwealth.

Partnerships have existed over several decades in the case of RETRIDOL and SADC-CDE, and new regional centers have emerged with additions of PACFOLD and the 3CL Foundation over the last several years. The partnership between COL and RETRIDOL and SADC-CDE has been sustained over time because of continuous investment in human and financial resources on the part of both COL and the Regional Centres' hosting organizations – a point that has been articulated to the other two Regional Centres relative to growth and sustainability. External circumstances have also elevated the visibility of the Regional Centres. The New Zealand

government made a sizeable investment in PACFOLD and the University of the South Pacific, and there have been discussions to strengthen the relationship with regional bodies in West and Southern Africa. The extent that COL and the Regional Centres may deepen their partnership, with the prospect of securing additional funding from external sources, is the likeliest scenario toward continued sustainability, and more importantly growth.

### Canadian Case Studies

In Canada, province-wide needs to develop a more cohesive and comprehensive learning culture in the uptake of online learning were paramount. A differentiator in the Canada-centered case studies was that resources and technical expertise were locally available. There was also direct government involvement and oversight as these partnerships and collaborations were intended to serve each province's taxpayers. Indeed, COL and the PEBL network imparted accountability mechanisms, but as multilateral initiatives, the involvement of government funders was lessened. Scrutinizing the nuances of domestic or internationally formed partnerships, relative to value for money and impact, is beyond the scope of this chapter, though evaluations of entities, in three case studies cited earlier, included a review of expenditures (see Higher Education Quality Council of Ontario, 2020; McGreal, 2020; Young et al., 2021).

The BCcampus and eCampusOntario case studies were designated as **propositional collaborations** and predicated on creating a robust, comprehensive, and evolving online learning ecosystem that would include all the publicly funded postsecondary institutions in each province. The visions from each entity were complementary – eCampusOntario was the spawn of BCcampus yet diverged based on the context of Ontario. Both entities carried a mandate to enhance the student learning experience and did so by identifying visionary goals rather than fully identified need. BCcampus promoted learner access to courses across institutions in British Columbia, developed a comprehensive repository of open textbooks, and engaged other province-wide entities to offer complementary or shared services. Its counterpart in Ontario was tasked with responding to nearly twice the number of institutions. It emulated the work of BCcampus by creating its own open textbook repository for Ontario faculty and students and providing information on transfer requirements between institutions, developing microcredentials, and other innovations.

The propositional collaborations to which we aligned BCcampus and eCampusOntario required an approach of “building the plane as you fly.” It required well-resourced funders, and each provincial government was in concert with these entities. In both cases, bold moves were made that necessitated accepting risk that the 70+ institutions shared between the two provinces would buy in to their idea of advancing teaching and learning. As evidenced in the case studies, the risks paid off, and both BCcampus and eCampusOntario continue to make inroads through innovation and providing resonant value to their constituents.

---

## Conclusion

As we conclude, it should not be assumed that mutual service alliances are a better fit to meet the educational needs in the emerging world context, or that propositional collaborations are a better fit to meet the educational needs for the well resourced. Partnerships are contextual, and in those we have identified, the binding element is to advance access to quality learning suitable for rapidly changing social and economic conditions. The presentation of the four case studies demonstrates the variance in pathways to achieve this end. Any view to sustainability must recognize partnerships as dynamic, subject to change, and not necessarily bound by fixed deliverables, time frames, or resources.

## Abstract

How do colleges and universities market online learning? This chapter explores contemporary approaches to marketing online courses and programs and uses the historical lens of marketing Athabasca courses and degrees as a backcloth for

understanding the unique challenges for this work. The chapter introduces a new approach to the marketing funnel as well as an understanding of the growing importance of social media in marketing to potential learners. The growing global competition for learners is also explored. The growing use of analytics and the challenges of overcoming myths are also discussed. The chapter gives emphasis to the importance of retaining students as well as “capture” of a student registration.

**Introduction: Understanding Context**

Marketing any product or service in a highly competitive market is difficult and challenging, especially when the market constantly changes and the “customer” is a sophisticated buyer. It demands a deep understanding of what successful customers both expect and like about the product and services they have purchased and an ability to identify the unique value proposition associated with the organization offering that product or service. It also requires those engaged in marketing to position the products and services on offer with integrity – recognizing their strengths, limitations, and weaknesses. Marketing is not easy, as this chapter will demonstrate.

Based on 30 years of marketing experience in Canada and on significant reviews of marketing activities in Australia, Britain, Europe, and other countries, this chapter offers an overview of the work involved in marketing for online, distance, and open education.

The chapter is focused on the challenges faced in marketing something “different” (online learning) from what is understood as “normal” (face-to-face teaching) and on the core processes required to secure and retain a student registration and to build on student completion to secure the next registration.

---

**The Products and Services Have Changed Over Time: Posing New Marketing Challenges and Opportunities**

Before looking at marketing as a process and offering a description of the key components of contemporary marketing for online and distance learning, it is important to recognize that the challenges faced by those who market and secure registrations have changed over time. This is important because, as the sector has developed, the challenges faced have been different and each phase has demanded a different marketing response.

Distance education began with Pitman shorthand courses and, in 1858, the opportunity to use distance education and assessment by mail to complete a degree in law at the University of London. From the beginning, the three key issues of access, quality, and cost have shaped much of the challenge which marketing needed to address. This chapter uses a case study of Athabasca University – Canada’s leading online and distance teaching university offering courses from skills upgrading to masters and doctoral degrees to approximately 40,000 learners across Canada and around the world each year. This case study will highlight many of the challenges that those marketing online and distance learning continue to face and will set the stage for an understanding of what the current marketing challenges in this space are.

### **The 1970s Positioning the New and Responding to Issues About Quality**

When open and distance education began in Canada in the 1970s with the founding of Athabasca University in Alberta and Télé-université in Quebec, marketing needed to convey a very specific value proposition. For Athabasca University, anyone over the age of 18 could begin studying a university-level course or program irrespective of past educational performance or experience – no prior educational admission requirements – which raised issues of quality in the minds of some. These were new propositions, alien to a great many.

Further, learners could begin their studies whenever they were ready (the university has 12 admission periods for undergraduate courses – it was not semester based) and learners could call for assessment when they were ready to do so, which changed the pattern of recruitment and registration. This too was new and required a lot of explanation.

Learning resources – mainly print with some audio and later video (1977) – were dispatched to the learners’ home and learners connected to their assigned tutor by telephone. Those studying science had mini-lab kits sent to their home for some basic experiments. This was very much the situation between 1970 and 1994, with audio and videoconferencing (optional) becoming available in the mid-1980s. This required marketing to position “self-study” and 1:1 tutoring as effective ways of learning – again, new to a great many people.

A specific challenge at Athabasca University was to increase the number of students pursuing programs and qualifications at Athabasca rather than simply using courses to transfer credit to other institutions. For example, in 1994–1995 there were some 11,386 Athabasca undergraduate students but 92% of these were taking just one or two courses and then transferring their credits to other programs across Canada. While this is a good thing and is in line with the lifelong learning mandate of the university, it meant the university was graduating between 200 and 250 students with a first degree annually and this created issues of brand perception for government and others.

The second challenge in this period was the low level of course completion. In the 1990s, completion rates for students new to distance education students at Athabasca were approximately 38% and for students who were continuing their studies about 47%. A key challenge for marketing was to overcome the idea that studying at a distance was “hard” and that completion rates “were so low that it was not worth the money.” Again, this posed significant challenges for marketing teams, as it continues to do for many engaged in marketing online and distance learning around the world.

The third challenge, which is connected to these first two, was just the scale of registrations needed to sustain the institution, tuition revenue being a key component of the financial health of the organization. Because of the high turnover of students (low number of courses taken and low completion rates), the university needed to grow by 10% each year from a base of 25,000 course registrations which meant securing some 23,000 new course registrations from approximately 17,500 individuals new to distance education. Securing new registrations from existing students or past students became a key marketing strategy – a point returned to below. Athabasca became resilient and robust because it knew how to do this work well.

## **1994 and the Arrival of Online Learning**

In 1994 the Internet and online learning began to “take off,” with Athabasca University offering the world’s first fully online MBA alongside other graduate programs in distance education and nursing and some online undergraduate courses, especially in business, nursing, and professional studies.

The Internet posed new marketing challenges, since access to the Internet was not widely available (it is still not available in large parts of rural Canada and to Indigenous communities living on reserve lands) and required telephones to be hooked up to a telephone modem cradle device – something which few people had.

But online learning has grown very rapidly. By early 2011 in just one Canadian Province – Ontario – there were over 25,000 undergraduate-level courses available online from publicly funded colleges and universities which had attracted 830,000 registrations. What is more, completion rates for online learning were high – 76% for colleges and 85% for universities, both of which required program admission based on prior educational achievement, unlike Athabasca.

Satisfaction studies, whether at an institutional level or system level, have also shown a high degree of satisfaction with students’ learning experiences. A 2002 Government of Alberta study placed Athabasca University first among the four universities in Alberta for satisfaction with the relevance of courses, overall educational experience, and value for money. Frequent satisfaction studies undertaken by Contact North | Contact Nord in Ontario also show high satisfaction levels from students with their online learning experience.

## 2012 MOOCs and the Globalization of Learning

The first massive open online course (MOOC) was created by Stephen Downes and George Siemens and was called *Connectivism and Connective Knowledge* and offered through the University of Manitoba in 2008. But the real sea change from a marketing perspective came in 2012 when two professors at Stanford offered *An Introduction to Artificial Intelligence* for free and 160,000 individuals from around the world engaged with this course. The creators – Sebastian Thrun and Peter Norvig – saw potential and created *Udacity* (2012) which was soon joined by MIT's *EdX* (2012) and *Coursera* (2012), with the Open University (UK) and 11 other universities creating *FutureLearn* in 2012. Also in play was Udemy, founded in 2010 as an open marketplace portal for online courses developed by others. Unlike Coursera, which is a curated marketplace portal (only “topflight” institutions or organizations can offer courses on its platform), Udemy is open to any provider able to offer a course. Udemy's courses are largely vocational, with a strong focus on technology, business, and design.

Quite quickly, many quality and free online courses were offered which attracted very large numbers of learners. Not all were interested in qualifications or assessment – they wanted to access to quality learning, not credit. But the existence of MOOCs and their growth changed the dynamics of the market, not least by making online learning part of the fast growing, globalized market for education and demonstrating both the advantages and challenges of learning at scale.

Also at this time, other players entered the global market. The University of Phoenix, founded in 1976 as a private university (now owned by private investors), secured a significant market share in the USA when it moved its programs online in 1989, though repeatedly failed to gain a foothold in Canada. By 2010, it was registering over 470,750 students in its degree and diploma programs worldwide and was reporting revenues of US\$4.5 billion.

Various attempts by others to “go global,” such as the Open University's failed attempt to enter the US market in 1999 (it closed in 2002 – Meyer [2015]) and the failure of AllLearn – a consortium formed in 2000 by Yale, Stanford, and Oxford to offer online courses worldwide, point to the marketing and recruitment challenges of a global offer at that time. After spending over US\$12million, it closed in 2006. In 2000, Columbia University sank US\$30 million into an online learning initiative called Fathom, which failed to secure sufficient registrations and closed after just 3 years. Purdue University's global division, created following the university's acquisition of Kaplan, has lost over \$63 million in its first 2 years of operation. One explanation: “a deliberate and focused investment of \$28.5 million in marketing” produced a gain of just 2,000 new students. These examples show how complex securing student registrations can be: Even major universities with significant marketing resources and access to world-class academic expertise have failed (Watters, 2021).

MOOCs also provide an interesting case. Originally conceived as free, accessible, and fully online lifelong learning opportunities, the MOOC providers quickly

realized that revenues were key to survival. Launched in 2012 and pushed hard in the following 8 years, MOOC providers gradually shifted from free to fee and from being credential free to focusing increasingly on credentials, especially micro-credentials and degrees. EdX was created with a \$60 million “starting” fund from Harvard and MIT (it more recently sold for \$600 million to an online program management company); FutureLearn was launched with initial funding from the Open University (UK) and its partner institutions. In 2019, FutureLearn secured £50 million (approximately US\$69 million) from SEEK Ltd. in exchange for majority ownership. Coursera had raised \$300 million before the pandemic.

By December 2019, some 13,500 MOOCs were offered on a number of major platforms from over 900 hundred universities and colleges and had secured 120 million students worldwide. As part of their offer there were 820 microcredentials (certificates, nano-degrees, specializations, and MicroMasters) and 50 full degrees. Coursera was the single largest player in this market (45 million learners, 3,800 courses) followed by EdX (24 million learners, 2,640 courses), Udacity (11.5 million learners, 200 courses), and FutureLearn (10 million learners, 1,000 courses). These developments are important: They help create demand for all forms of online learning and give some credibility to this form of studying. The MOOC strategy 2012–2019 was to build capacity and gain market share. But now they are focused on profitability, which is moving them into the credentials space on a global scale.

## **2020 and the Pivot to Online During the Pandemic**

The global COVID-19 pandemic forced 1.4 billion learners to pivot to some form of remote learning, with many experiencing this form of instruction for the first time. This created challenges and opportunities for new services and new approaches to the market.

MOOCs were already well positioned to respond to the challenge of remote learning. In 2020, Coursera attracted 31 million learners, EdX 10 million and FutureLearn five million. Indeed, according to Class Central’s MOOC monitor (Shah, 2020), one-third of all learners who ever registered for a MOOC since they began did so in 2020. What is more, MOOC providers secured in excess of US\$900 million in new funding, enabling the major players to rebrand and expand their market base through more targeted programming and the development of subscription-based services (an annual fee for access to a wide range of courses rather than “pay by course”). So successful was 2020 for the entire MOOC sector that Coursera launched itself on the New York Stock Exchange and was able to raise \$4.52 billion in its initial public offering. At the time of writing (October 2021), the company shares were trading at US\$32.81 indicating that the company is retaining its market value despite continuing to lose money (\$46.5 million in the second quarter of 2021) (Shah, 2020).

These developments are shaping aspects of the market: a demand for “on-demand” courses, skills assessments, and credentials; growing demand for short-duration courses and programs that demonstrate to employers that those who

complete them have skills and competencies they are seeking; and highly affordable courses and new forms of credentials.

This marketing journey – the building blocks on which current marketing strategies and work are based – demonstrates how agile and nimble providers of online learning have had to be, especially as the market becomes more complex, global, and competitive.

---

## The Process of Marketing Online and Distance Learning Services

There are a variety of approaches to marketing educational services (Kotler & Keller, 2014; Miller, 2017). Experience suggests that there are six key elements for any marketing team seeking to ensure student registrations and growth in overall volumes. In this section of the chapter, we will explore these six elements in detail.

### Element 1: Building the Brand Story: Differentiation

The beginning of any marketing effort is the need to build brand identity and brand story in the marketplace. The underlying task of brand development is differentiation – ensuring that the institution is seen to be both a way of meeting a potential student’s need and doing so differently from others. Differentiation in the market is the purpose of brand strategy (Porter, 1996).

This sounds straightforward, but it is in fact a difficult challenge. The brand story has to be powerful, different, and effective but cannot be so different from the brand story of other learning providers that it raises questions about whether the brand claims are realistic, out of line with the norms of the sector or just “whacky.” In particular, claims about the value of a course or program in terms of employment need especial care – job markets change, as does the value attached to specific programs and the skills needed for employment. The University of Phoenix, for example, has been fined for false advertising related to job placement and employment opportunities linked to its programs. In 2019, these false claims cost the university US\$191 million, \$141 million of which was paid directly to the students directly impacted by the claims (Brooks, 2019).

Key brand messages include ideas of “smart learning,” “flexible learning,” “anytime learning,” and “quality learning.” The brand identity is often presented through individual success stories, testimonials from employers, or others who act as brand ambassadors. For example, the popular comedian and star of award-winning TV show *Schitt’s Creek*, Dan Levy, recently championed the MOOC *Indigenous Canada* offered by the University of Alberta (Bench, 2020). By doing so, he significantly increased registrations but also created what is known as brand presence: ensuring that the University of Alberta was in the MOOC business and that this course was a high-quality experience across a range of public platforms (newspapers, television, and radio) and social media.

One challenge the marketing team has is ensuring that the brand they are building and sharing in the marketplace accurately reflects the experience students have of their courses and the institution. At the Open Polytechnic of New Zealand, the marketing team have invested a considerable amount of energy and time mapping the customer journey in the institution and in identifying the moments of truth in that journey – those experiences which put the brand claims to the test. For example, if a tutor suddenly is unavailable to support the learner at a time of their greatest need or when a tutor takes 2 months to provide feedback on an assignment, what do these moments say about the claim to be “a highly personalized and responsive” learning service? Frequent surveys of student experience, such as First Impressions Surveys (Open Polytechnic, 2020) or focus groups looking at student satisfaction, are all key components of ensuring that the brand story aligns with experience.

## **Element 2: Target Marketing and Market Segmentation**

Blanket marketing campaigns on radio, television, newsprint, or social media are used to create the large brand story, but most student recruitment campaigns are focused on targeted groups in specific communities. Blanket campaigns are expensive and produce some returns on investment, but they are more about brand positioning than recruitment.

For example, a study program focused on upskilling cybersecurity capabilities of people working in the financial services sector or an MBA in Hockey Management or a microcredential in chemicals handling has specific markets that can be directly targeted, and the impact of this investment can be measured in terms of enquiries, applications, and registrations.

To do this well, the marketing team need to have a clear understanding of who a course or program of study is intended for and what the demographics of that target market are. That is, they need to undertake a clear market segment analysis of who is taking the course or program now and how that profile suggests targeted marketing activities. The more we know about how existing students learned about the course or program, what the characteristics of these students are, and what the key factors influencing their decision to register in this program with this institution were, the more accurately the marketing team can target their marketing efforts.

If the program of study is brand new or the mode of delivery so different from how such programs are normally delivered, then a close understanding of the market segment can come from connections with employers, focus groups with potential students, and an in-depth set of conversations with those creating the program. For example, a new program for food service workers who work exclusively in eldercare facilities has a clear target market which, when well researched, can be reached quickly and effectively.

### **Element 3: Mining Niche Markets and Services**

“Mining” a market – aggressively pursuing a specific segment over a long period of time to secure ongoing registrations and repeat business from the same segment of the population – is an established practice. For example, certain professions, like accounting, require both initial certifications through accredited learning and ongoing learning for continuing professional development. Universities and colleges recognize this market and “mine” it as a niche market, making sure that their courses and programs meet certification requirements of the profession, teach to the current practice standards within the profession, and are widely understood to be of quality.

Some examples of these market niches have produced rich returns for online and distance learning institutions:

- Helping practical nurses (PNs) become registered nurses (RNs) and then helping registered nurses secure a degree in nursing (and offering a route to masters and doctoral degrees). There is a range of online programs offered by a variety of institutions and also nursing degrees by assessment of competences and capabilities marketed by the University of Wisconsin and Western Governors University in the USA.
- Helping teaching assistants working in schools qualify as teachers through flexible and online learning. The Open University (UK) pioneered this development.
- Customizing master’s degrees for specific organizations. For example, AT&T partnered with Georgia Tech and Udacity to offer a master’s degree in computer science through Udacity’s MOOC platform. Athabasca University has a customized MBA for those seeking a career in hockey management.
- Courses and programs in mechatronics that begin online and include lab and fieldwork.

Access to specialist data-based partnerships and alliances with professional bodies and unions, using partnerships with lending organizations (banks, financial services) to ensure that those in certain sectors (e.g., IT and creative industries) know about available programs, are all being used as means of securing access to these niche markets.

### **Element 4: Social Media and Digital Marketing**

According to a study by Converge Consulting (Oleson & Kelly, 2016), the majority of potential students for a course or program are significantly influenced in their decision to take the course from a specific institution by social media. Indeed, a variety of studies show that Facebook, Instagram, Twitter, and Snapchat are the “go

to” sources that will trigger an inquiry from a potential student – much more than any other media (Ascione, 2018; Credo, 2016; Lytle, 2012). Any modern marketing campaign must leverage these platforms.

The challenge is to know where to invest the available energy and scarce resources: There are so many platforms and so many competing “voices” on these platforms. The resolution, at least for most college and university marketing departments, is to focus on a small number of platforms that produce registrations. In particular, Facebook and LinkedIn are platforms which are most commonly used, especially when mature students are the target market.

The primary uses of these platform are: (a) to share student stories of success; (b) to provide employer testimonials of the value to them of a course or program of study; (c) to be a component in the launch of new programs and courses; and (d) to celebrate milestones and successes of the institution. All of these posts on social media are intended to drive traffic to the college or university website and all of this activity is traceable. Social media are primarily about building awareness and encouraging consideration, though some have been doing more with social media to make the decision to commit easier (Kim, 2020).

Supporting the inquiry process is also key and students expect rapid response to email, text messages, and phone calls. Some marketing departments have deployed artificial intelligence (AI)-enabled chatbots to support recruitment, admission, and financial aid. They are being deployed at American universities such as Purdue University (AtlasRTX), Rockhurst and Georgia State (Nazarenko, 2020), and by several colleges and universities across Canada and around the world. Their primary value is that they operate around the clock and can be trained to offer empathic, accurate, and appropriate advice. This is especially useful for international recruitments across a range of time zones.

## **Element 5: Focus on Retention Not Just Attraction**

A great deal of energy is spent securing a first-time student for a university or college. The real opportunity is to continue to secure registrations in courses and programs from that same student over time. Between the offer of the first distance education course by Athabasca University in 1973 (the course was *World Ecology*) and 2003, it had secured over 490,500 course registrations. Just 142,681 (29%) had taken five or more courses. The cost of securing each new student in 2003 was approximately eight times that of securing a new course registration from an existing student. Retention is a lower-cost way of ensuring registration growth and of developing a “word-of-mouth” recruitment opportunity.

Ormond Simpson (2005) wrote about this challenge in the context of the UK Open University. He suggested that the cost of each new student recruited at that time was approximately £500 (US\$685), with some 30% of the cost of recruitment going to replace students who dropped out. Indeed, the starting point for his analysis is this statement:

Higher education is a strange business. No other form of manufacturing would take in tested components (new students) and produce a final product (graduates) with a wastage rate of 20% or more. Or at least if such a business existed then it would very rapidly go bankrupt. (Simpson, 2005, p. 34)

These kinds of observations have led to the widespread use of both predictive and prescriptive analytics to reduce dropout (when a student stops studying) and dropdown (when a student delays their studies for a period of time). Predictive analytics shows what will happen in the future, whereas prescriptive analytics recommends which actions to take to improve outcomes (Bilella, 2013).

A typical analytics solution uses both to determine how students respond to different marketing and recruitment campaigns throughout the enrollment cycle and makes suggestions for appropriate intervention. Using such analytics can have a significant impact on retention. For example, Texas Tech University was able to grow their enrolment at 9% annually but also increased student retention by 2.6% using their analytics solution. Others have reported more spectacular results, including a 22% gain in graduation rates at the University of South Florida (Civitas, 2020).

## **Element 6: Using Analytics and Customer Relationship Management (CRM) Systems to Track Return on Marketing Investment**

The growing use of data for evidence-based decisions in marketing is a key characteristic of an effective marketing strategy. The marketing team need to understand the return on investment from the marketing activities in which they are engaged. This requires a highly disciplined use of customer relationship management software like Salesforce, PeopleSoft, Intelliworks, or Azorus and the focused use of analytics from all of the digital activities in which the team is engaged.

Typically, marketing teams will describe the “funnel” – the stages in the journey to registration and completion of a program. There are a variety of versions of the funnel, but the University of Newcastle (UK) has adopted a particular language for their funnel which is insightful. Rather than use the traditional funnel (shown on the left in Fig. 1) they have adopted the language of building brand champions or advocates (shown on the right in Fig. 1).

The aim of the marketing team is to ensure that every student and alumnus is more than satisfied with their learning experience, but is an active brand ambassador. The best form of marketing is “word of mouth” and a recommendation from a graduate to a potential student is the strongest form of marketing, as well as the least expensive. This is why the question “would you recommend this course/program to a friend or colleague” is a critical piece of data when looking at student satisfaction.

The funnel helps the marketing team understand whether a particular targeted marketing campaign worked and if it did, in which market segments and at what

Normative Funnel	University of Newcastle Funnel
Prospects / Inquiries – securing enquiries and page views	<ul style="list-style-type: none"> <li>Consider – a learner explores options and, in doing so, is steered towards Newcastle</li> </ul>
Applications – securing applications for courses and programs	<ul style="list-style-type: none"> <li>Decision – a learner decides both what they want to learn and where and makes an application</li> </ul>
Acceptance – securing an acceptance of an offer	<ul style="list-style-type: none"> <li>Adoption – the learner receives an offer and accepts it and begins to adopt the identity of belonging to the university.</li> </ul>
Deposit – securing a payment.	<ul style="list-style-type: none"> <li>Advocate – the learner becomes an active advocate for the university, its courses and programs and recruits others</li> </ul>

**Fig. 1** The marketing funnels

cost per registered student. It also helps us see the extent to which alumni and graduates act as advocates and brand ambassadors, championing the work of the institution.

### **Even After 50 Years, Marketing Still Has to Address Some Persistent Issues**

Despite significant investments in marketing and branding of online and distance education over the last 50 years, some issues remain in the public domain that have been difficult to change. Three in particular have challenged every single marketing team.

#### **“Face to Face is Best and Online and Distance are Not as Good”**

Despite compelling evidence of there being no significant difference in learning outcomes between online and face-to-face learning (Russell, 1999; Nguyen, 2015) and substantial evidence of the inefficacy of face-to-face instruction (Bernard et al., 2004; Bethel & Bernard, 2010; Tamim, Bernard, Borokhovski, Abrami, & Schmid, 2011), the idea that face to face is better persists in the public consciousness. In part, this is understandable – almost all compulsory schooling is face to face and the bulk of higher education around the world is also face to face. Yet (before COVID-19) registration in face-to-face learning has slowed significantly and in some regions declined, while in North America, online registrations have grown dramatically (Lederman, 2018). In the USA, for example, 6.9 million learners (35.3% of all postsecondary learners) were enrolled in online courses at degree-granting institutions in 2020 (before COVID-19) and the majority preferred this form of learning to

face to face (Wallis, 2020). The online market is expanding even more rapidly in the Asia-Pacific region.

There is growing evidence for the efficacy of online learning – higher rates of knowledge retention (Keegan, 2020) and more rapid acquisition of knowledge, skills, and capabilities (Schoox, 2018).

### **“The Loneliness of the Long-Distance Learner”**

This idea – that the student is on their own with little support and has to be a “self-starter to survive” – became a dominant kind of idea in the 1970–1994 period, before the Internet (Robinson, 1989). Sadly, the idea has persisted (Ferguson et al., 2020). Marketing has to be just as much about the range of supports and services and the ways in which help (from technical help to study skills, career guidance, and course choice) is available either by audio or videoconference or through integrated computer-mediated systems.

### **“It Must Be Easier to Do Online, and Therefore It Should Be Cheaper: After All, There is Not as Much Instruction”**

Online and distance education courses that are effective and show significant outcomes are instructionally designed, highly engaging, and involve significant levels of both peer-to-peer and instructor support. Typical expenditure on an Open University UK course before the emergence of the Internet and its widespread use would be in the order of £3–5 million, including television production, radio, and high-quality course packages. The learning was more demanding than many anticipated and there were fewer places to “hide” as a learner. Tutors did know how you were doing and examinations and assessments were substantive. Rather than being easier, the learning and assessments were more comprehensive than in many face-to-face classes. Yet, this meme persisted for some time (and does so today in some markets). The marketing strategy of using academics from other institutions to praise courses as “challenging” and “comprehensive,” sharing independent assessments, and using student testimonials has largely countered this narrative.

### **“It Is Easy to Cheat in an Online Course: So Where Is the Quality?”**

The earliest recorded cases of cheating involved a civil service entrance examination in China thousands of years ago. Cheating on exams and bribery for academic honors was written about in *The Book of Swindles* published in 1617. Benjamin Franklin also had to retract a 1756 paper for reasons of inappropriate use of other people’s data. It is not a new problem, but the perception in the marketplace is that cheating is rife in online and distance education.

The scale of the problem for all forms of higher education (face to face *and* online) is substantial. A 2018 study from *Turnitin* suggested 16% of the 38.3 million papers analyzed by their software-matched papers developed by essay mills. In an analysis of cheating, Eaton (2018) found between 3.5% and 7.9% of students surveyed across the world admitted to paying for writing services. One study suggests the figure could be as high as 22% (Thomas, 2015), with some students buying more than one paper. Canada ranks fourth in the world for these kinds of purchases (Eaton, 2018). These data relate to all students – there is no compelling evidence that online students cheat less or more than students studying in class or in blended learning. The challenge is that many in the market, especially some influencers, think that online makes it easier to cheat.

These perceptual issues – based on beliefs and a value set supported by some examples – have persisted over a long period of time. Developments in assessment, including the use of biometrics, virtual proctoring systems, AI-based pattern recognition systems, and plagiarism detection software, all make cheating online easier to detect. The evidence of no significant difference in learning outcomes between face to face and online is compelling. But market perceptions persist despite evidence, the development of new tools, and systematic evaluations of the challenges (Fig. 2).

Marketing teams cannot ignore these concerns and memes and others like them. What they need are direct, clear, and unequivocal answers to the challenge or

**Fig. 2** Advertising materials from Athabasca University (2015), Canada

problem and for this to be the systematic, standard, and consistent response for the institution. Consistent, optimistic, and evidence-based but effective communication is needed to counter these challenges. Humor can also be helpful in this work, as the “tongue-in-cheek” advertisement below from Athabasca University makes clear.

---

## Conclusion

There is a growing evidence base for the effective work of marketing teams, aided now by access to rich analytics and customer relationship management (CRM) tracking data. But marketing is still an art form that commands imagination and creativity. Not every university or college needs to use the image of a student in a cap and gown at graduation as a key component of the brand image of the institution, yet many still use this image. In seeking to differentiate an online and distance education, creative design and imaginative advertising have been used to sharply differentiate this form of learning from more traditional approaches, with varying levels of success. From powerful images, quirky images, and quotations the aim is to catch the eye, imagination and interest of a potential or existing student help them make a commitment to the next step in their learning journey. The ultimate aim is: recruit every student as a member of the marketing arm of the institution as brand ambassador and program recruiter. Creativity, imagination, evidence-based work, and effective communication are the hallmarks of this work.

**Abstract**

Innovation is the lifeblood of open, distance and digital education (ODDE), but it has often proved difficult for ODDE institutions to continue to innovate in response to a changing world outside. Innovation though is not “magic” or serendipitous. There are well-established methods by which innovation can be nurtured and managed in ODDE. Following a literature review of innovation in ODDE, the chapter discusses common myths regarding innovation, several barriers to change in ODDE institutions, then offers five strategies to support innovation. A case study is provided that illustrates a number of factors that support sustained innovation in ODDE, and the chapter ends by suggesting that innovation is not an end in itself but is best managed by focusing on the major, long-term goals of ODDE, and the main challenges that ODDE institutions face. In particular, ODDE institutions need to remain innovative to meet increasing competition from the conventional higher education institutions and above all from large, digital technology companies.

## **What Is Meant by “Innovation”?**

Most of the literature defines innovation as the implementation not only of new ideas, knowledge, and practices but also of improved ideas, knowledge, and practices (Kostoff, 2003; Mitchell, 2003). Innovation is thus different from reform or change.

The OECD (2016) has suggested that innovation indicators in the education sector should be linked to specific social and educational objectives such as learning outcomes, cost efficiency, equity, or public satisfaction. Indicators in the ODDE field might also include increased access, lower cost, completion rates, equity, and inclusion for learners.

The key point is that innovation should be judged by the extent to which it adds value, either to an institution as a whole, or more specifically for its targeted students.

---

## **Why Is Innovation So Important in ODDE?**

There are several reasons – or drivers – that make innovation particularly important for ODDE.

## **Innovation Is Part of the Lifeblood of ODDE**

Open and distance education has a long history. Because it originally lay outside conventional education, it was often seen (certainly within the ODDE community) as being radically different and therefore, by definition, innovative.

Another driver of innovation in ODDE is that ODDE has always depended heavily on technology: the postal service, printing, on-demand publishing, radio and television, desktop computers, and then the Internet. The constant change in technology has often been the stimulus for renewed innovation in ODDE.

Another driver of innovation – at least in the past – has been the desire to bring down the cost per unit/student through economies of scale. The large national open universities created in the 1970s are one example. More recently, Massive Open Online Courses (MOOCs) are another. However, economies of scale have not proved always to be compatible with maintenance of quality, at least as measured by completion rates. A better understanding now exists about the relationship between cost and quality (see Daniel, Kanwar, & Uvalić-Trumbić, 2009), but the high cost of postsecondary education remains an issue. Politicians and others outside education still tend to see the potential of open and online learning and the use of digital technologies for reducing the costs of education, but this will require yet more innovation in ODDE.

A further driver of innovation – the “open” part – has been based on widening access, serving students who have not been well served by conventional institutions. This has resulted in no or lower tuition fees, no prior qualifications being needed for entry to university studies, prior learning assessment, and more recently, open educational resources (OER). Access also has been widened beyond reducing the cost to learners and widening access, to embracing diversity, in race, physical disabilities, and for others marginalized in society, such as prisoners.

However, Covid-19 demonstrated clearly that when all learners need to go online extremely quickly without adequate time for preparation, this can lead to serious problems of inequity, such as lack of access to equipment or adequate bandwidth (see Commonwealth of Learning, 2021). Overcoming such inequities again will require innovation in the delivery of digital services by ODDE if they are to reach the already underserved with digital learning.

So innovation has been – and should continue to be – an essential component of ODDE.

## **Innovation: Technology or Teaching?**

Although there is a long history of innovations brought about by ODDE, nevertheless, there are still challenges. Too often the focus is on technology, but not on improved learning.

A major challenge in the second decade of the twenty-first century is a need to focus on developing the high-level intellectual skills that enable learners not only to meet the rapidly changing demands in the job market due to automation, digitalization, and continuous “churn” in jobs, but also to enable learners to manage their lives and participate more actively and with more autonomy in a digital society, dominated in large part by giant network corporations and increasingly authoritarian governments. Freedom and autonomy in such a context demand a high level of digital literacy in everyone.

Our educational systems are by and large predicated on an industrial model, with a heavy focus on the transmission and acquisition of knowledge, whereas in a digital age, learners need to develop intellectual and practical skills. Students no longer need to study all together at the same time and place. Knowledge, or at least content, is accessible everywhere through the Internet, and increasingly for free. Accessing information is not the problem, but knowing where to find it, how to evaluate it, analyze it, integrate it, and apply it are all skills. This means looking at teaching methods that help develop these, and many other skills, such as independent learning, critical thinking, teamwork, and communication skills. In order to develop such skills in ODDE, it will be necessary to change teaching methods, use of technology, and organizational structures – in other words, it will be essential to continue to innovate.

So, the test for any attempt at innovation in ODDE should not be: Is it different? Instead, we should ask: Will it lead to better learning suitable for a digital age? This will mean focusing on innovation in teaching methods and management practices as much as on the use of new technologies.

### **Why Is Innovation So Difficult in ODDE?**

Innovation in general is often perceived as being difficult. Governments struggle with innovation strategies, many previously well-established companies have disappeared because they were unable to adapt to a changing external environment (think of Xerox or Kodak), and education in general still reflects the structures and organization of the late nineteenth century industrial age.

After a while, all institutions tend to revert to hierarchical structures geared toward rewarding compliance rather than change. ODDE institutions are no exception. Although radical and innovative when first created, open universities, for instance, became much more bureaucratic as their size increased, and complacent as a result of their initial success.

In particular, open universities created around the mass communications of large-scale printing, radio, and television made heavy investments in specific technologies. Also, being the new players in the game, the large open universities needed to demonstrate the quality of their programs. This was done by using an extensive and expensive course design process, made possible by the large numbers of students enrolling: high fixed cost and low marginal cost course development. Because of the size of their departmental budgets, heads of these “production” departments often wielded considerable powers of decision-making and hence tended to resist changes, especially in technology, that may threaten their power within an organization. Success also breeds complacency: Why change if it is working well?

Furthermore, for almost 20 years between 1970 and 1990, new technologies, such as audio and video cassettes, video discs, and even computer-based learning, were successfully integrated by the large open universities, merely supplementing rather than replacing the core technologies of print and broadcasting.

The Internet changed all that. The natural reaction of the large open universities was again to try to integrate the Internet and other digital technology, adding online discussion forums, and desk-top printing, for instance, while still maintaining their core technology of print, especially.

Dual-mode universities that were primarily not only campus-based but also offered selective distance education courses and programs could not match the high-cost, low-marginal cost model of distance education courses of the large open universities. Distance education course enrolment numbers for dual mode institutions were usually much smaller. They therefore needed a lighter and nimbler course development model.

However, it also meant that when the Internet came along, it was easier for dual mode institutions to change their design model to give much more emphasis to fully online courses using html, web pages, and very quickly, specially designed online learning management systems such as WebCT (which later became Blackboard). WebCT was developed by the University of British Columbia, a very traditional, campus-based institution. Dual-mode institutions found the fully online courses quicker to design and launch and provided quicker and more intensive interaction between students and instructors than their former print-based courses. More importantly, it was easier (although still difficult) for dual mode institutions to switch from print to online, because their investment in print and broadcast technologies was much less.

As a result, by 2019, nearly all campus-based universities in Canada, for instance, were also offering at least some fully online courses for credit. Indeed, Université Laval, a campus-based university in Québec, in 2019 had more online course registrations than either Athabasca University or T luq, two solely distance education universities in Canada. As a general statement, dual-mode universities have been able to move much more quickly and completely to online learning than the large, distance education universities with a heavy prior investment in older technologies.

## **Some Lessons About Innovation in ODDE**

This very brief (and partial) history of innovation in ODDE offers several lessons about innovation.

1. Because the external world is rapidly changing, we need to develop ways of teaching and learning that meet these changing needs. To be of value, innovation must result in better outcomes; this means focusing as much on new ways of learning or different, more relevant, learning outcomes, as in the use of particular technologies.
2. There are at least two kinds of innovation: innovation that sustains existing organizations; and innovation that disrupts organizations. Incorporating, for instance, video cassettes into an organization already using broadcasting is a sustaining use of technology; using the Internet to switch from print-based or

classroom-based courses to fully online courses is a disruptive technology, because it replaces former ways of doing things.

3. Size matters. It is much more difficult to innovate in a large organization or a large department, because there is so much capital (human and financial) invested in maintaining the current system. To encourage and sustain innovation in larger organizations, a much higher level of internal intervention (for instance, an institution-wide, commonly agreed strategic plan for digital learning) or of external threat (for instance, Covid-19) is needed.
4. Innovation is an ongoing need in the field of ODDE, whose main goal is to provide attractive alternatives to the conventional education system. Especially as a result of Covid-19, many conventional institutions are undergoing rapid change and innovation, and this is leading them increasingly into ODDE's traditional territory; therefore, every ODDE institution needs a strategy for supporting and sustaining innovation that distinguishes it from its competitors, if it is to survive.

---

## Literature Review

It would be fair to say that, despite its importance, innovation and change is an under-researched area in ODDE.

Zawacki-Richter, Alturki, and Aldraiweesh (2017), in an analysis of research areas covered by the International Review of Research in Open and Distance Learning (IRRODL) between 2000 and 2015, ranked innovation and change last, with less than 2 per cent of the published articles being on this topic (compared with, for example, instructional design – 18 per cent). A similar study by Wong, Zeng, and Ho (2016) analyzed articles from seven different journals focused on open and distance learning (ODL). They found that in 2015, only 3 per cent of articles (six in total) were about innovation and change (compared with 21 per cent, or 42 articles, on instructional design).

Nevertheless, there have been a few but still significant studies of innovation and change in ODDE. In 2001, Lockwood and Gooley published “Innovation in Open & Distance Learning: Successful Development of Online and Web-Based Learning” which included 19 case studies of successful innovations in ODL. Although the several technology-based innovations reported in the book are now dated, the Introduction by Fred Lockwood and Chap. 2 on lessons from experience and research on innovation in ODL by Bernadette Robinson are as relevant today as they were more than 20 years ago. Their analysis of the factors that support or inhibit innovation will be referred to frequently in this chapter.

Just over 10 years later, Bates and Sangrà (2011) published “Managing Technology in Higher Education.” Its subtitle, “Strategies for Transforming Teaching and Learning,” indicated its focus on innovation and change. The book was based on 11 cases (6 from Europe and 5 from North America). Although the topic was broader than innovation in just ODL, two of the cases were open universities, and several of the other cases from dual-mode institutions were related to the development of new blended, online, or distance learning programs or strategies. The book looked at the

role of leadership, organizational structures, quality assurance, resources, and barriers to change in supporting or inhibiting innovation. Again, some of the key findings from this book will be referenced later in this chapter.

Naffi (2020) conducted interviews with directors or staff at 19 Centers of Teaching and Learning across five countries regarding the role of Centers for Teaching and Learning in the pivot to online learning during the Covid-19 pandemic. The report illustrated the important role of such centers in facilitating and supporting innovation in the move to online teaching and learning.

Lee (2021), using Athabasca University as case study, asked the question: “to what extent can online higher education (HE) be open and innovative at the same time?” Using discourse analysis based on the work of Foucault, an analysis of official and internal documents over the last 40 years, and interviews with current learning designers, Lee argues that there has been an increasing level of discontinuity between the conceptualization of openness and innovation as independent principles and the operationalization of the two: “Being pedagogically innovative by increasing interactivity among students while maintaining the same level of flexibility provided by the independent study model seems very challenging.” This chapter also discusses the institutional conditions that make teaching-oriented innovation more difficult to achieve.

Lastly, in recent years, Contact North in Ontario, Canada, has collected over 200 “Pockets of Innovation” in online, blended, and technology-enhanced learning from higher education institutions around the world. It has summarized these in a single report (Contact North, 2019) that includes a section devoted to organizational planning for online learning.

Then there is a whole world of publications that tend to equate technology with innovation, as Bates and Sangrà (2011) noted. One example of this is the OECD (2016) publication “Innovating Education and Educating for Innovation.” This report concluded (p.3) that “despite the huge potential of digitalisation for fostering and enhancing learning, the impact of digital technologies on education itself has been shallow.” Significantly, it concluded (p.3) that “[education] has not managed to harness technology to raise productivity, improve efficiency, increase quality and foster equity in the way other public sectors have.” However, the focus of the OECD report was on school education, and one wonders whether the OECD would have the same view following higher education’s response to Covid-19.

There are other areas that apply generally to higher education but nevertheless are also relevant to managing innovation and change in ODDE, such as leadership (see Paul, 1990, 2011), organizational culture (Silver, 1998; Zhu & Engels, 2013), and change management (Bradfield & Clark, undated; Brown, 2013), and some articles that embrace all three (see Setzer & Morris, 2015).

There is indeed a large literature on these topics outside of ODDE, or even education, especially from the business world. One must be careful to avoid assuming that what works in business will work equally well in education, but nevertheless there is still much to be learned about successful innovation from these sources. For instance, Rogers’ (1995) “Diffusion of Innovations” is still relevant today. There is much innovation going on at the individual instructor level, but the challenge many

times is to move this beyond what Rogers calls “early adopters” into the main teaching body. Similarly, Drucker (2002) commented: “In innovation, there is talent, there is ingenuity, and there is knowledge. But when it’s said and done, what innovation requires is hard, focused, purposeful work.”

Thus, although the literature on managing innovation in ODDE itself is quite rare, there are many lessons already learned about managing innovation and change, from both within higher education and outside. The findings are surprisingly consistent between the studies, but it would be fair to say that while institutional leaders are sometimes unaware of or ignore these principles, more often they run into common barriers to change which have proved formidable in the higher education sector.

This chapter will attempt to summarize some of the main issues arising from these studies, as well as draw on the author’s personal experience of managing innovation and change in three open universities and three conventional higher education institutions, as well as his work on Contact North’s Pockets of Innovation.

---

## Five Destructive “myths” About Innovation

Morriss-Olson (2020) states that *“one of the major roadblocks in the way of our success is that over time, institutional leaders have accepted a number of harmful myths about innovation as truths. These myths also play a critical role in limiting our willingness to take risks and to pilot and scale up new initiatives.”*

**Myth 1. Innovation is “difficult,”** thus leading to an avoidance of even attempting change. Quoting Drucker, Morriss-Olson points out that most effective innovations start small, are simple, and are focused. This means nurturing a climate that encourages individual, small changes, and welcomes sharing and cross-pollination of ideas. Anyone can innovate – but it needs hard work, trial, and error and also needs to be institutionally supported.

**Myth 2. Innovation “just happens.”** On the contrary, most innovations incubate slowly, over several years, and are the result of many small, incremental changes.

**Myth 3. Innovation happens in a vacuum.** Isolating innovation within an organization to a nonoperational “research” area or “skunk-works” may help get something new started, but as Morriss-Olson states: *“Eventually, “worthwhile innovation initiatives are most likely to succeed over time when they can fully leverage existing organizational assets and capabilities.”* In particular, *“networks that broadly facilitate shared interactions enable ideas to diffuse, circulate, and combine with other ideas.”*

**Myth 4. Innovation is something only creative geniuses can do.** However, Morriss-Olson argues that *“people who are presumed to be “genius” innovators most often earned their success through mundane problem-solving methods: hard work and trial and error. What this means is that any one of us and every one of us has the potential to innovate.”*

**Myth 5. Innovation is always good.** *“Innovation is change. And with change there are always winners and losers.”* Also, change can have unexpected and unintended consequences.

Usher (2021) is highly critical of government approaches to fostering innovation based on the idea of “moonshots.” Usher argues that governments consider a “moonshot” as “doing something big,” such as being the first to land a man on the moon (a literal moonshot) or Operation Warp Speed to develop a Covid-19 vaccine. However, Usher argues that:

*Moonshots are a by-product of existential threats. Countries don't do moonshots because they wake up one morning and say “hey, let's do big thing”, they do it because they are deeply terrified of what will happen if they don't invest heavily in this one complex task.*

In most cases, though, innovation starts much smaller, usually in an attempt to fix a particular problem or to improve service to clients or, in the case of ODDE, to learners.

The message that needs to be taken away from these myths or misconceptions is that innovation is not only possible in any organization, but also manageable, if the right steps are taken.

---

## Barriers to Innovation and Change

Nevertheless, it is important to recognize that there are formidable barriers to innovation and change in all higher education institutions. Bates and Sangrà (2011) identified a number of barriers to innovation from their 11 case studies, and in a totally separate study, involving 426 individuals in multiple ODL projects across 17 countries, Robinson (2000) encountered many of the same challenges:

1. *Lack of effective leadership.* There are several ways leaders can encourage or inhibit innovation in ODDE. Innovation will be supported if there is a clear vision and strategy for teaching and learning that encompasses modes of delivery, learning outcomes, and teaching methods. This provides a context not only for stimulating innovation but also for evaluating it.

Second, diffused leadership – where a range of people at different levels in the organization have responsibilities for innovation and change – is more likely to foster innovation than a charismatic leader or a single individual being responsible for innovation and change. With charismatic leaders, the change becomes personal; when they leave, the innovation often dies without them.

2. *Organizational structure and culture.* Bates and Sangrà (2011, p.129) noted that “one major limitation is the industrial-style organizational structure of universities and colleges, and in particular the silos of academic, administrative and

technological support units.” Without a supportive, networked, organizational structure, innovations remain isolated and unsupported.

Schein (2005) defines organizational culture as “a pattern of shared basic assumptions that . . . has worked well enough to be considered valid and is passed to new members as the correct way to perceive, think and feel in relation to these problems.” Innovation though can often challenge such basic assumptions – indeed, changing such assumptions may be a direct goal of innovation – but often innovation, especially in teaching, can run afoul of a deeply embedded organizational culture. This particularly applies to what is considered “good teaching” in universities and colleges, such as large lectures (Bligh, 2000), and to power structures, such as the autonomy of the tenured faculty member in deciding what and how to teach. In the worst case, it can result in instructors ignoring the advice of experts in online design, for instance.

3. *Lack of systematic training in teaching.* Bates and Sangrà (2011, p.195) state that “the use of technology [for teaching] needs to be combined with an understanding of how students learn, how skills and competencies are developed, how knowledge is represented through different media, and how learners use different senses for learning.” Without such basic understanding, innovation in teaching will not be valid or successful – or at least very difficult – because instructors lack the necessary foundation on which to build successful innovations in teaching.
4. *Managerial incompetence.* Bates and Sangra found in the case studies that program directors, heads of departments, deans, vice-presidents, and vice rectors were often struggling with decision-making regarding the use of technology for teaching and learning. They were often in a position of making decisions without the basic knowledge and understanding of either technology or of basic pedagogy. Without such understanding, it was difficult for such managers to foster or assess potential innovations in teaching. Bates and Sangrà (2011) also noted that there was a tendency to give precedence to IT managers over educators when decisions were needed about technology for teaching, thus ensuring that the innovative technology would be little used by instructors who had not been adequately consulted.
5. *Lack of resources.* Robinson (2000) noted (p.14) that in 63% of the cases she studied, “innovative ODL initiatives were under-resourced in financial and human terms.” Bates and Sangrà (2011, p.152)) noted that priority in the allocation of resources understandably goes to supporting the traditional teaching system. This means that innovative teaching is either an addition to the regular work of an instructor, or is done “on the side.” However, instructors need time to experiment, innovative teaching often needs to be supported by other specialists, such as instructional designers or media producers, and the innovation needs to be properly evaluated in comparison with traditional methods of teaching.

Both Bates and Sangrà, and Robinson, observed that the relative costs of fully online, blended, and face-to-face teaching were often not well known or understood

by managers trying to innovate in ODL. Adequate resources need to be available to support innovation in teaching, if this is a key objective. Bates and Sangrà were clearly critical of the way higher education institutions were approaching innovation and change in 2011. (It should be noted that their criticisms extended as much to ODDE institutions as to more conventional institutions.) There have been some major changes in higher education since then. A good deal of learning has taken place. Thus we need also to look at strategies that have been found to foster innovation and change in teaching and learning.

---

## Strategies to Support Innovative Teaching

Bates and Sangrà (2011), as a result of their 11 case studies, came forward with five strategies to support innovative teaching.

### Think Holistically

For innovations to succeed, the full complexity of an organization must be considered. Bates and Sangrà wrote: “At a senior management level, it is essential to think holistically about the management of technology. Senior managers need to have the whole picture about where decisions are made about the use of technology for teaching.” Without “the big picture,” it will be difficult if not impossible to support and expand innovative teaching beyond the individual instructor.

More significantly, many institutions today either have a strategy for e-learning or digital learning or are developing one for the whole institution. For instance, in 2018, 42 per cent of all public universities and colleges in Canada either had a fully implemented e-learning plan or were implementing one, and a further 29% were developing one (Johnson, 2019). These plans involve decisions at all levels, from the senior executive through deans and heads of departments, to individual instructors and often students. Such plans provide a framework to support and nurture innovation in teaching.

### Multiple Visions of Teaching and Learning

Although individual instructors will always find ways to innovate in their teaching, Bates and Sangrà (p.218) argue that this needs to be placed in a broader context where institutions – or at least academic departments – are willing fundamentally to rethink the whole teaching and learning paradigm. “We need to move away from the dominant paradigm of the fixed time and place classroom as the default model for university and college teaching, and think of all the many other ways we could organise and manage teaching. In particular, we need to think very concretely about what teaching and learning should look like in the future. Our reach should exceed

our grasp, driven by our assessment of the needs of students in the twenty-first century, and not by the existing institutional requirements that they must fit into. The best place to develop such a vision is at the program level.” This though requires individual instructors to work collaboratively to agree curricula, appropriate modes of delivery, and teaching methods, which can again run against the grain of organizational culture.

## **Strategic Goals for Teaching and Learning**

By definition, the results of innovation are often unpredictable. As Morriss-Olson (2020) states, innovation is not always good – or at least not good for everyone. This raises the question then of what we are wanting to achieve in our teaching and learning. Without such a framework or set of criteria, it will be difficult to decide whether or not to support or adopt an innovation. At the same time, as a result of innovation, it may be necessary to rethink or reexamine our academic goals. Bates and Sangrà (2011, p.223) list a whole range of possible academic goals that could be supported by learning technologies, but these need to be defined and agreed particularly at the program level, within an overall academic plan. This leads to the fourth strategy.

## **An Annual Academic Planning Process That Includes Innovation in Teaching**

Bates and Sangrà suggested (p.224-225): “an annual rolling 3- or 5-year planning process for the academic plan which integrates learning technology and academic planning. . . modified each year in the light of new developments.”

This is where discussion of the balance between online and face-to-face learning, new teaching methods, such as blended or HyFlex learning, the result of the previous year’s innovations, and use and choice of technologies would take place, again, primarily at the program level. Such planning would also focus on supporting and prioritizing innovative teaching in the coming year.

## **Funding to Support Innovative Teaching**

Programs should be encouraged to innovate in their teaching, to look at better ways to deliver and evaluate programs. Funding to support this could be built into the Provost’s budget, where additional funds could be earmarked for programs seeking new and more effective ways to teach, as well as funding for individual instructors who wish to try something new in departments or programs that otherwise are not being innovative (you have to start somewhere). Such funding should require a plan for the evaluation and diffusion of the innovation.

---

## The OECD's Solution

The OECD report (2016) suggested a number of strategies to support innovation in education, some of which are just as applicable to ODDE institutions:

- A compelling vision can align internal and external stakeholders around the need for change. Setting ambitious goals, particularly nearly impossible ones, forces the entire system to innovate and drive toward those goals [but see earlier comments about “moonshots” – getting the right balance between “stretchable” and impossible goals is always a challenge].
- Improved measurement must be the foundation of innovation in education. Based on a solid definition of “improvement” at different levels in the system, regular data collection should assess changes over time in improved pedagogical and organizational practices.
- Benchmark and track progress: High-quality data at the program and course level allows senior management – and everyone – to see progress toward the goals. It can also be used by senior managers as a discussion point with deans, heads of departments, and instructors to identify and troubleshoot problems.
- Evaluate and share the performance of new innovation: Innovations need to actually work. For ODDE institutions to encourage quality, there needs to be transparent information on how effective new innovations and technologies are – do they work, over what time period, and based on what criteria?
- Combine greater accountability and autonomy: Devolving authority to the program level can remove barriers to innovation and allow heads of department and instructors the flexibility to explore new approaches. Increased autonomy needs to be paired with increased accountability, in which such managers and instructors are accountable for the choices and results they deliver. This accountability requires greater transparency and clear performance metrics.

While these recommendations are fine in principle, they come from a business perspective and do not reflect the somewhat different culture of educational institutions. The OECD recommendations need to be modified a little for ODDE (see Section “[Is innovation ‘manageable’?](#)”).

---

## A Case Study

To illustrate how different factors, such as adequate resources, leadership, strategic goals, networking across organizational boundaries, and a supportive organizational culture, all influence innovation in an ODDE context, a specific case study will be used, based on the author’s personal experience. The case in point is now 25 years old, which is probably an appropriate timeline to judge the success of the innovation.

The University of British Columbia is a large, campus-based research university, with over 66,000 students. In 1994, the provincial government decided to withhold

1.5% of each public postsecondary institution's annual operating budget, and to place it in a province-wide "innovation in teaching" fund. The institutions could then submit proposals for supporting innovation in teaching that if accepted would release the withheld funds. In UBC's case, as a large university with a large budget, the amount withheld was substantial: over \$2 million.

The Provost called a special meeting of all the deans and other senior managers to agree on a university-wide proposal to secure the funds (some other institutions left it just to individual faculty to apply for individual innovation grants). Each academic department was asked to develop proposals for innovative teaching, but the Provost also put forward proposals for some central funding, such as a new Centre for Educational Technology. UBC was eventually successful in recovering the full \$2 million for its innovating teaching proposal.

Also at the same time, the Dean of Continuing Studies, in consultation with the Provost, hired an external expert in online and distance learning to work, not only with Continuing Studies noncredit programs, but also particularly with the main academic departments that were offering credit- and print-based distance courses, to help move these courses online. The Provost and Dean of Continuing Studies provided a special online course development fund of \$1 million for this purpose to be managed by the new Director of Distance Education and Technology.

A young, untenured instructor in the Department of Computer Sciences had also received a small grant from the Innovation Fund to develop an online platform to support his classroom teaching, where he could add text materials and activities for students. This proved to be quite successful, but he needed a relatively small amount of extra money for graduate students to help with the computer programming to turn it into a reliable off-the-shelf platform. The Provost and the Director of Distance Education agreed to allocate some of the online course development money for this purpose, as the platform, called WebCT, could also be modified and used as a standard learning management system for the online courses. WebCT speeded up considerably the design of the fully online courses, as well as supporting the instructor's classroom teaching. WebCT was the world's first widely used course management system for higher education. At its height, it was in use by over 10 million students in 80 countries and was acquired several years later by Blackboard Inc.

The university went on not only to convert all of its existing undergraduate print-based distance education courses to fully online courses, but also to develop a new range of online courses, in particular several fully online, cost-recoverable professional masters programs. These programs were based on a carefully constructed business plan, some of which, following discussions with the Provost, were funded by loans from the university Treasury, which invested unallocated cash for building construction usually in safe investments such as guaranteed investment certificates, but in this case used a relatively small amount of this money to kick-start these cost-recoverable programs.

In addition, the Centre for Educational Technology and the Distance Education unit, which had hired additional instructional and web designers, worked with mainline faculty to use technology in their teaching. For instance, a professor of

forest ecology, working with a couple of his graduate students and a media producer from Distance Education, developed an interactive CD-ROM to replace a physical “walk through the forest.”

Three years later, as part of UBC’s Academic Plan, Trek 2000, a strategic plan was developed on how to facilitate the use of information technology and new media in learning by faculty, staff, and students. This resulted in a report to Senate in 2000 (*University of British Columbia, 2000*), which set a number of goals for the development of learning technologies at UBC. A Centre for Teaching, Learning, and Technology was established by merging the Distance Education Unit from Continuing Studies with the Centre for Educational Technology, which reported to the Provost and supported faculty across all departments.

This burst of successful innovation over a period of 5 years between 1995 and 2000 illustrates a number of key points:

- Adequate resources: The Innovation Fund and the Distance Education course development fund provided a good deal of flexibility and incentive for online and technology-based learning initiatives.
- Leadership: The role of the Provost was critical. He pulled together his deans and other senior managers to develop a plan, followed carefully how the Innovation Fund was being used, brought together key people from different departments to ensure collaboration, but devolved actual decisions about innovative teaching to the departments or individual instructors – he did not try to “pick winners.”
- There was a good deal of cross-organizational collaboration, although later this was rationalized to some extent by a reorganization of roles and funding.
- There was a plan – in fact, there were two. The first was a centralized proposal to the government for the Innovation Fund, and the second in 2000 for a university-wide approach to the use of learning technologies.
- There were clear, measurable outcomes that included a world-class Learning Management System; conversion of all print-based courses to fully online courses; the development of new, cost-recoverable online graduate programs; and a university-wide teaching and learning center for faculty development and to support the use of learning technologies.
- Innovation was not a “one-shot trick” but moved forward on several interrelated fronts and was ongoing over many years.

---

## Is Innovation “manageable”?

This is a good debating question, similar to “Can you teach creativity”? By its nature, innovation is somewhat unpredictable, and certainly a heavy managerial approach could be the kiss of death for innovation in ODDE. “Picking winners,” a favourite with many national governments, is another approach to innovation, but again, the results are often highly disappointing. True innovation often comes from unexpected sources and in contradiction to current managerial directions.

Nevertheless, there are certain approaches that can foster or encourage innovation, as we saw in the previous sections, but it may need a more indirect approach. For instance, the focus should probably not be on innovation itself, but on the educational goals that an ODDE organization is aiming to achieve. Innovation would be one means by which to achieve such goals.

For instance, if we take the Covid-19 crisis, which struck half-way through the Spring semester in 2020, the main goal of most campus-based institutions was to enable students successfully to complete the semester. Given that students, instructors, or staff would not be allowed to congregate on campus or in face-to-face classes, some other way of delivering courses was needed. The answer was to take a mode of delivery that had previously been very specialized and limited to less than 10 per cent of all students and courses, and make that the standard delivery mode, as a short-term solution. Most instructors and students were totally unprepared for online teaching, but they managed it, because there were easy to use tools that allowed instructors to mainly preserve their mode of classroom teaching but in an online environment, and because both instructors and students wanted to save the semester if possible. Over time, lessons were learned, and the teaching improved – innovation was taking place. The goal was not though to move all teaching online or to “innovate”; it was to safeguard the academic year for students. Emergency remote teaching was the innovation that made the goal possible.

ODDE institutions may need to look at the main challenges they are facing and then look to innovation to help resolve those challenges. For instance, there is increasing demand for “21<sup>st</sup> century skills” such as critical thinking, knowledge management, and digital literacy, and for shorter, more flexible programs that can meet rapidly changing external conditions, especially but not exclusively in the work force.

In particular, as the Commonwealth of Learning report (2021) indicated, without active intervention, digital learning can increase inequity (see also Collis & Vegas, 2020). How can ODDE institutions innovate to reduce such inequity while at the same time increasing the use of digital learning?

What changes would need to be made to curricula and teaching methods to meet such demand? How can these demands be met for all students, and not just a select few? What technologies or new teaching approaches, and new policies, need to be put in place for successful, quality programs of this type? What advantages (and disadvantages) do ODDE institutions have in meeting these goals compared with traditional institutions?

It should be the educational goals here, particularly increased access and equity and inclusion, that should drive innovation in ODDE institutions. Flexible delivery, new curricula, new or different teaching methods, microcredentials, and low cost, accessible tools could all be innovations needed to meet such goals.

---

## Summary and Conclusion

Innovation is part of the life-stream of ODDE institutions. Once they stop innovating, they risk becoming irrelevant, as conventional institutions are increasingly moving into traditional ODDE territory.

Also, there are now other potential competitors for the ODDE market, particularly the large digital technology companies. For instance, Linked-In Learning (formerly known as Lynda.com but now owned by Microsoft) offers more than 16,000 courses, 9000 of which are in English. Each is broken down into multiple short videos with specific learning goals. Linked-In Learning offers content to those studying for professional certification exams or earning continuing education credits. The platform has 34 certification courses. More importantly, Linked-In Learning can analyze all the data on current employer requirements through their job advertising on the Linked-In platform and use that as a base for identifying the latest requirements for training. Similar competition is coming from MOOC providers such as Udemy and Coursera, and from Google Career Certificates. The UK Open University has responded in part with its own MOOC platform, FutureLearn.

However, managing innovation is not a simple process. There are substantial barriers to change built into all educational institutions, and ODDE institutions are no exception. In the end, though, it comes down to having relevant, challenging strategic goals that move the institution forward. This is what should drive innovation. Innovation is a means to an end: more relevant, high quality education for those learners most disadvantaged and not well served by the traditional system or other external competitors. Focusing on how to do that will inevitably lead to more innovation in ODDE, but it will require the step-by-step hard work that Drucker noted more than 20 years ago.

## Abstract

Open and distance education has a long history and rich heritage, its literature affirming that a systems approach based on industrial production is an optimal means of providing education that is accessible, cost-effective, flexible, open, and scalable. This approach to education, based on an asynchronous separation of participants, continues to find its expression in the Internet age. The recent COVID-19 global pandemic necessitated a rapid shift to emergency remote teaching (ERT). This sudden adoption of online education took place more in response to need than careful strategizing. Significantly, the term “online distance education” is often used to describe the mostly synchronous ERT model, even though this is out of step with classic distance education theory. This chapter explores the differences across educational models beneath the terms “conventional education” and “open, distance digital education (ODDE),” and the nature of “transformation” as conventional and distance models of education are

expressed online. Transforming conventional education through ODDE challenges our thinking as to the nature of education practice and the potential of digital technology in the twenty-first-century context. The potential of ODDE – anytime enrolment and assessment, effectiveness and efficiency in tuition, enhancing student success by design and personalized provision – goes well beyond extending the classroom into the online space. For on-campus providers to become effective ODDE providers, a transformation is required. The final part of this chapter deals with the challenges of rethinking the role of the educator and of reformulating a university’s operating model.

**Introduction**

In education, what does it mean to “go online”? What does it mean to “transform” a university? Does the apparent inevitability of going online require a transformation? And what have the recent challenges of COVID-19 revealed about global readiness for online education? These are complex questions. Not only does “going online” mean more than one thing, but the term “transformation” is also all-too-frequently used to imply any challenging change, even where these changes do not fundamentally alter practice.

The Internet has transformed multiple elements of twenty-first-century life, yet many of the trappings of conventional education practice have remained remarkably similar for hundreds of years. Transformation of practice, it seems, is rare in higher education. This chapter explores why “going online” can fall well short of transformative objectives and suggests how conventional education might move to truly realize the benefits of open, digital distance education (ODDE). Transformation is not a term to use lightly, nor is it an automatic outcome of extending the use of online technologies. In the context of transformation being used as an umbrella term for change, this chapter aims to provide decision-makers with an authoritative vocabulary and pathway toward transformation, in part to assist readers in “resisting the influence of others with limited expertise in online education” (Beaudoin, 2016, p. 17).

---

**Terminology: Conventional Education, ODDE, and Transformation**

The challenge of describing how conventional education might be transformed through open, distance digital education (ODDE) is firstly conceptual; definitions tend to be clumsily applied in literature. In his overview of literature related to online and distance education, Paul notes that many authors “take their own terminology

for granted” (2014, p. 176). Where does the term “ODDE” sit in the context of terminology including “blended learning,” “e-learning,” “flexible learning,” “technology enhanced learning,” and “online education”? Further, how do these terms relate to “distance education” – a term that is descriptive of a wide variety of practice while also serving as the title of a significant field of scholarship? This chapter assumes ODDE as the contemporary phrase used to describe the scholarship and thinking that has classic distance education literature as its heritage. Charles Wedemeyer, Michael Moore, Börge Holmberg, Otto Peters, Sir John Daniel, and Tony Bates – and the editors and authors associated with this book – are among the thinkers and practitioners whose work ODDE builds upon.

Conventional education might be defined as “a teaching method involving instructors and the students interacting in a face-to-face manner in the classroom. These instructors initiate discussions in the classroom, and focus exclusively on knowing content in textbooks and notes” (Li, 2016, pp. 105–106). Conventional education broadly consists of authoritative perspectives and voices (instructors) and interpersonal engagement in real time in a physical setting (the classroom), drawing primarily on reference works (selected by the instructors). Using the term “conventional” to describe this model highlights its apparent normative nature, in that other forms of education are constantly compared with this traditional convention even though it is not necessarily a gold standard.

ODDE is much more difficult to define, mainly because the “distance digital education” part can be applied to *any* form of online education that enables at least some separation from the classroom, even if a classroom still features. ODDE “is complex in nature and scope as it involves a wide range of non-traditional ways of teaching and learning that are mediated by various media and technologies” (Jung, 2019, p. 1). For example, a lecture theater providing a live, streamed option might be validly described as providing a distance digital education option. To “go online,” then, is to enter the distance digital education sphere of practice to some degree. However that “online” (or “digital”) is not the same as “distance” has been well understood in ODDE circles for some time (Guri-Rosenblit, 2005, 2014). The distinctions between the two are fundamental to any discussion about transformation in education, because distance education as a scholarly discipline has a tradition of accessibility, cost-effectiveness, flexibility, openness, and scalability. Distance education scholarship is rooted in the benefits and practice of print-based correspondence learning. As technology matured, distance education scholarship broadened to complementing correspondence resources with multimedia, and then online discussion through bulletin boards and discussion forums as further dimensions were added to the generations of distance education (Nipper, 1989). As online possibilities extend, the genealogy of this classic form continues to express its largely asynchronous traits.

A spike in journal publications about distance education started in 2004 (Amoozegar, Khodabandelou, & Ebrahim, 2018). At about the same time a distinctive phase of the journal *Distance Education* from 2005 to 2009 is identifiable as being when “online education is beginning to be seen as the new face of distance education. . . as distance education is becoming about online education, it is quickly

becoming fashionable to be in this business” (Zawacki-Richter & Naidu, 2016, pp. 258–259). Since around 2005, when online possibilities became more mainstream, the term “distance education” increasingly became used to describe normal, synchronous practice extended through the Internet. In more contemporary practice, Zoom and Teams provide synchronous contact whereby the trappings of conventional education are extended into “distance education” practice. The terminological difficulty here is obvious: “distance education” is both a description of any practice allowing a physical separation between instructor and learner, and of a scholarly discipline that traditionally promotes distance education as a predominantly asynchronous pursuit in support of the nontraditional, “backdoor” learner.

ODDE, of course, emphasizes the concept of “openness.” Unfortunately this is yet another nebulous term; over 30 years ago it was said that “the terms ‘open learning’ and ‘distance learning’ have never been used precisely” (Rumble, 1989, p. 28), an issue that still confronts scholars today. Helpfully it is possible to describe various principles of “open and distance learning” that, together, contribute to the uniqueness of ODDE. Open education is motivated by a desire to democratize education as an element of social justice (Daniel, 2019), typically through the development of custom learning materials designed to a high standard. Open and distance learning approaches are also seen as key to breaking the so-called iron triangle of access, quality, and cost of education such that cost-effective, high-quality, mass availability might be possible all at once without the traditional trade-off across these (Daniel, Kanwar, & Uvalić-Trumbić, 2009). Asynchronicity – the ability for tuition to take place independent of time – is a natural feature of the approach, as the voice of the instructor is largely predetermined through specially developed courseware.

It is helpful to consider conventional education and ODDE as having synchronous and asynchronous biases, respectively. In conventional education, the teacher’s identity is obvious; they are the face, voice, and presenter of authority, and the institution is designed around their availability through timetabling. However, in open approaches, the teacher tends to be a facilitator; the entire institution is designed around the open model; and the overall approach is designed to operate effectively at scale. Broadly speaking, in conventional education, a teacher is the teaching point of reference; in ODDE, it is a set of learning materials supported by an academic and/or tutor. A conventional education educator is able to work in isolation; an ODDE educator is invariably a member of a team including, at the least, a learning designer. Conventional education tends to promote live instruction; ODDE tends to be predetermined. Conventional education can be easily traced back to the classroom; ODDE can be traced back to classical distance education models.

The distinctions here are best illustrated in their most extreme and appreciative forms. In the paradigm of conventional education:

- The voice of the instructors brings the subject to life, giving the subject a coherent, up-to-date scholarship and interpersonal authority through the instructors’ credentials and research.

- The teacher is almost solely responsible for the tuition provided by the student and, at the least, is the primary authority on course-related issues.
- Attendance in the classroom exposes students to the energy, passion, and insight of instructors they may academically aspire to emulate and to one another as a group of peers involved with processing the same ideas at the same time.
- The immediacy of conversation, the opportunity to question instructors, and the artifacts of campus and schedule all serve to stimulate learning and promote the student's sense of academic journey.
- Lecturing/teaching, timetabling, student cohorts, campus services, due dates, and teaching ratios are central to planning.

In the paradigm of ODDE:

- Well-designed and engaging learning materials bring the subject to life, giving the subject a clear, substantial series of explanations in the form of a learning journey.
- The education experienced by students consists of the contribution of multiple specialists, including learning designers, subject experts, media developers, and tutorial support staff.
- Students are in the pursuit of a valid qualification made up of meaningful learning and, for the sake of convenience and access, view engagement with other students as desirable but not essential for their success.
- For whatever purposes including employment and family commitments, real-time attendance at any venue is unlikely to be a priority. Learning materials and institutional success services including academic representation are vital elements of academic tuition.
- Course materials development (and maintenance), the adjunct workforce, online interface UX, success services, and improving flexibility are central to planning.

Additional elements might also be mentioned but the paradigms can at least be differentiated. A summary of the differences, useful as a basis for discussing transformation, is in Table 1.

Significantly, “going online” does not force any change to the table whatsoever. All aspects of the conventional and ODDE paradigms can be facilitated digitally, and, where doing so enables learning to take place outside of the classroom, “digital distance education” might be said to be taking place. ODDE, though, is

**Table 1** Differences between conventional and ODDE teaching models

	Conventional	ODDE
<b>Synchronicity</b>	Full	Minimal
<b>Tuition responsibility</b>	Teacher	Team
<b>Instructor voice</b>	Live	Predetermined

<b>Peer involvement</b>	Conversational	Optional

only properly taking place where *openness* is also apparent, which is where the learning experience is based on asynchronicity and is scalable in ways that break the iron triangle of access, quality, and cost.

## Emergency Remote Teaching and ODDE

What would happen if classroom-based, synchronous learners were suddenly independently isolated from their instructor? What would the digital response resemble? In the paradigm of Table 1, the response would likely be an immediate transfer of practice through the application of online tools. Such is the COVID-19 emergency response teaching (ERT) phenomenon, though sadly the mixed success of ERT is often described in terms of online or distance transformation and therefore as proof that “distance education” is a questionable form of education seen as a compromise by students, and as overly demanding by teachers. Unfortunately, this conclusion is a category error; what ERT has demonstrated is the logical outcome of digitally transferring conventional education under urgency. Zoom became foundational to the education experience, highlighting the synchronous, conventional model’s transfer into online education. Any slur on the reputation of “distance education” resulting from this online extension is limited to ERT practice and should not be projected across the traditional asynchronous heritage and practice of “distance education” as a scholarly pursuit. ODDE, for the most part, did not need an emergency response; its asynchronous model was already robust enough to cope with closed campuses and lockdowns.

The purpose here is not to disparage the importance of the ERT response and the sincere efforts of those who quickly adapted to new, challenging circumstances. It is sufficient to point out that there was not a sudden uptake of ODDE practice among educators during the pandemic. One systematic literature review concerning the educational response to the pandemic proposes a SWOT (strengths, weaknesses, opportunities, threats) analysis “on the digital transformation to online learning” (Talib, Bettayeb, & Omer, 2021, p. 3). The article concludes that:

The flexibility and convenience ODE offers and the much-needed push for change it has inspired cannot be denied. However, its efficiency in terms of student outcome as compared to traditional education is still a point of dispute. It is therefore imperative to continue investigating online education. (ibid., p. 21)

What is missing from this summary statement is a recommendation of further context: “. . .to continue investigating online education *as an extension of the conventional model.*” While ERT and ODE (online distance education) might be equivalent, ODE and ODDE (open distance digital education) are not the same thing. Instead, ERT as expressed through ODL might be considered a form of triage appropriate under emergency conditions, never intended as a long-term model of education (Reynolds & Chu, 2020), a view shared by many educators seeking to get back to the way they operated before the pandemic (Erdem-Aydin, 2021). It is

unfortunate that “experiences with ERT will, rightly or wrongly, influence perceptions of teaching and learning online for generations to come” (Stewart, 2021, p. 98). ERT, a digital form of conventional education, could never lead to the sustainable, systematic practice of ODDE because ERT is an extension of synchronous practice.

## The Nature of Transformation

Thus far, the terminology of conventional education and ODDE is considered. It is clear that these forms of education can both find their expression “online” in terms of Table 1, and so it is proposed that ERT (the response of educators to the COVID-19 pandemic) does not represent a shift from conventional education to ODDE. What, then, is transformation? When should we apply it as a term to describe change to educational practice?

Norris, Brodnick, Lefrere, Gilmour, and Baer (2013, p. 3) remind us that “just because we are changing a great deal does not mean we are transforming.” Much effort toward online education is more of a transference of incumbent practice than anything truly indicative of transformation. It is helpful to consider the R.A.T. and SAMR models at this point, both of which seek to describe how technology might influence conventional teaching practice. The R.A.T. framework suggests that technology might Replace, Amplify, or Transform teaching learning and curriculum practice (Hughes, 2021). ERT might be said to Replace conventional education insofar as technology provided a digital means for the same educational practice. Some elements were likely Amplified, as various educators sought to explore how a palette of digital potential might complement their online conventional instruction. The SAMR framework (Puentedura, 2006) describes technology as being applied in ways that *enhance* education through Substitution and Augmentation or *transform* education through Modification or Replacement of practice. Transformation, then, might be seen as a form of change whereby incumbent practice no longer resembles what was before. According to Norris et al. (2013), transformation involves four Rs: Redesign, Redefine, Reengineer, and Realign.

The nature of transformation rests in the scope of what needs to be changed for a new state to come about. In the terms of Norris et al., what needs to be Redesigned, Redefined, Reengineered, and Realigned is the *educational operating model*, defined as “how functions work and interrelate” (Nichols, 2020, p. 145), which can be likened to the institution’s DNA (Christensen & Eyring, 2013). An operating model is a description of how an organization actually works, consisting of those operational patterns and constraints that determine – and limit – how things are done. This is equivalent to the systems approach as defined by Moore and Kearsley, which “consists of all the component processes. . . including learning, teaching, communication, design, and management” (Moore & Kearsley, 1996, p. 5). As such, the operating model touches upon all elements of the institution, which must be designed in such a way as to align in support of the ODDE learner (Minnaar, 2013; Nichols, 2020). An operating model is expressed across both practice and policy and is typically taken for granted as part of the organization’s overall context.

Drawing on Norris et al. (2013), a transformation can be defined as a level of change that requires an educational operating model to be redesigned, teaching roles redefined, processes reengineered, and practices realigned with a new vision for teaching and learning.

Some forms of change – Hughes’s Replace and Amplify, Puentedura’s Substitution and Augmentation – might be said to bend rather than break the parameters of an operating model and so *transfer* existing practice within an existing operating model. Streaming lectures and making additional resources available through an LMS or VLE are changes to conventional education that do encourage study at a distance, but they do not require transformation as defined above. Other forms of change to the conventional education student experience – enabling students to enroll and complete anytime or study completely independently, which are more akin to open education – *would* require conventional education organizations to revisit their operating models and so could be described as truly transformative. Revisiting the conventional education and ODDE paradigms in Table 1, overlaying digital change, suggests a differentiation between transfer and transformation of practice as illustrated in Table 2.

Institutions, rather than individual practice, are configured to provide either conventional or ODDE education. The institutional operating model both determines and limits the approaches to education that can be sustained. The operating model required for conventional education requires a transformation if it is to truly enable ODDE and realize its benefits. In terms of taxonomy, “conventional” and “ODDE” might be considered separate genus of formal education. The differences between the two are such that ways of working are largely incompatible. The five elements of synchronicity, tuition responsibility, instructor voice, location of instruction, and peer involvement are all interrelated; together they form the expectations of and context for the teaching role and the expectations of students. An individual teacher, academic, or faculty member either has full responsibility for the tuition of “their class” or they do not. Either lectures are part of the teaching model, or they are not either a synchronous teaching timetable is required, or it is not.

Transformation of conventional education cannot be so much *through* ODDE as it must be *to* ODDE. The place of conventional education is left in favor of an ODDE destination. Conventional education is different to ODDE *to the extent that they are operationally incompatible*. Table 2 also illustrates why the term “blended” or

**Table 2** Digital change to conventional education and ODDE teaching models

	Conventional		Digital transform	ODDE	
	Digital transfer == >			< == Digital transfer	
<b>Synchronicity</b>	Full	Mostly		Some	Minimal
<b>Tuition responsibility</b>	Teacher	+ Assistance		+ Specialists	Team
<b>Instructor voice</b>	Live	+ Distributed		+ Added	Predetermined
<b>Location instruction</b>	Classroom	+ Distributed		+ Block	Independent
<b>Peer involvement</b>	Conversational	+ Mediated		+ Facilitated	Optional

“hybrid” is not straightforward; underneath any “blended” or “hybrid” practice is an operating model based around a particular teaching role. At its most fundamental, any teaching role either has at its foundation synchronous class time (or not) and reference to a cohort for timetabling purposes (or not). The teaching role determines and limits what a blended or hybrid model might offer students in terms of opportunity and flexibility, and so reflects either a conventional education or an ODDE starting point. The role of the learning designer or learning technologist also differs by starting point; under a conventional education paradigm, such a role will *complement* the teacher or member of faculty. In ODDE, the role is an established part of a course design team.

Conventional education is based on assumptions around education practice that are incompatible with ODDE. The difference is not so much one of “sage on the stage” vs. “guide on the side” or opportunities to study away from a classroom at distance as it is the conventional educator’s identity, which is founded on synchronous, timetabled tuition. Conventional education is simply not configured to provide the accessibility, cost-effectiveness, flexibility, openness, and scalability advantages that ODDE is able to further extend through digital practice. At the core, conventional education and ODDE have very different operating model requirements. In the words of Norris et al. (2013, p. 8), “Put simply, institutions have layered technology over existing practices, tinkering with them but not transforming them.”

---

## Why Transform?

Providers of higher education cannot ignore the sorts of trends already well underway across the HE sector: increased demand for online distance learning courses, increased competition, pressure on public funding, more use of adjunct staff, “off-the-shelf” learning content, competition across online learning management systems, and the rise of MOOCs are among those apparent almost a decade ago that continue to shape education practice (Amirault, 2012). Despite these trends, higher education has been remarkably unchanged by the disruptive elements of the digital revolution. Sector after sector has been – literally – transformed such that convenient access to banking, travel agencies, music and video media, government systems, taxi services, and consumer goods will never again resemble the commercial dynamics of the twentieth century. Access, convenience, cost-effectiveness, personalization, subscription, customization, and control are increasingly expected by twenty-first-century citizens. Conventional higher education, however, remains wedded to lectures, lecture theaters, timetables, and subject representation by a single expert. The operating model of conventional education universities reinforces these assumptions and perpetuates their longevity. The potential of digital education to provide a quality robust, accessible, cost-effective, flexible, scalable, supported, and personalized education – the very benefits twenty-first-century learners will increasingly expect (Nichols, 2020) – cannot be fully realized by the conventional education model.

The role of open, distance education has long been recognized as improving access and opportunity to education for those who otherwise might never have the opportunity to attend conventional education for whatever reason. Transforming conventional education to ODDE, then, is motivated by issues of social justice (increased inclusion) and continuous improvement (innovation unrestricted by synchronous tuition and timetabling). That such transformation leverages digital technologies is more opportunistic than techno-centric. Transformation to ODDE can take place within an education-centered philosophy, as described in Nichols (2020). ODDE need not require higher education to compromise its ultimate commitment to the standards of the academy.

## Facing Up to the Challenges

Transforming conventional education through ODDE requires facing up to several significant challenges facing higher education. Norris, Brodnick, Lefrere, Gilmour, and Baer (2014) propose the following challenges, identified here as they apply to the American higher education experience (transferable to the context of other countries):

- Challenge #1: Students and their families can no longer afford a college degree.
- Challenge #2: American higher education institutions are facing a sea of red ink – declining state support, burdensome institutional debt, unrealistic instructional costs, plateauing tuition revenues, and intense competition for adult learners.
- Challenge #3: American higher education has failed to assess student learning and performance.
- Challenge #4: Most institutions lack the organizational agility to meet rapidly changing student learning needs and the needs of the US economy.
- Challenge #5: Higher education has been unable to leverage technology to truly transform learning and competence building to be more accessible, relevant, challenging, and aligned with workforce needs.
- Challenge #6: Higher education has failed to learn from the disruptive innovations pioneered by the for-profit institutions.

This is not to disparage or dismiss the effectiveness of conventional education. Those students able to attend and willing to pay the costs of tuition and (likely) relocation for a full-time, on-campus study experience no doubt value the direct teaching presence, social and peer engagement, and the buzz and social serendipity that a campus can offer. Such settings will find, though, that further “going online” to increase flexibility and meet the expectations of twenty-first-century learners will likely serve to increase costs and place increasing pressure on teaching operating models. “Going online,” after all, places additional expectations on teaching staff and risks an inconsistent online experience for students as they advance from course to course (Nichols, 2020).

## Moving from a Supply-Centric Orientation

To be supply-centered is to place the institutional operating model above the flexible preferences of learners. While “online education” is increasingly endorsed as a means by which higher education might be made “cheaper, more accessible, and better” (Beaudoin, 2016, p. 11), it is the starting point of a conventional education or ODDE paradigm that determines whether these are achieved. ERT showed that taking conventional education online does not lead to cheaper and better education alongside accessibility. Incremental changes to the conventional education model may have made education more accessible and better, but certainly not cheaper. ODDE is designed to challenge the iron triangle and so improve access, reduce cost, and improve educational quality. This is demonstrated by one recent study that found online ODDE results in increased revenues because of increased openness, improving student access (Ives & Walsh, 2021). Some also propose that there is a sizable. This matches the impression of some that there is a sizable, likely growing portion of would-be students who are “cost-conscious, pragmatic learners. . . [seeking] Greater openness, flexibility, and adaptability” (Norris et al., 2013, p. 1), to the extent that traditional timetables and the limitations of semesterization are considered barriers to student choice and progress (Nichols, 2020; Norris et al., 2013).

It was mentioned earlier that education is remarkably unchanged by the digital revolution. One central reason for this is the supply-centeredness of conventional education and its inability to cater for the increasingly reasonable expectations of students for anytime, anyplace tuition that flexes around life’s circumstances and students’ individual learning strengths. That students for the main cannot access any higher education course at any time for individual study for a reasonable price, and be personally guided to a successful outcome, is more a matter of design than it is a limitation of education itself. Approaches to learning design, analytics, artificial intelligence, evidence-based improvement, flexible access, interpersonal engagement, and student achievement can all be underpinned by the focused work of education specialists in an education orientation that provides accessible, scalable, and personalized education (Nichols, 2020).

It should not be assumed that digital education involves the transfer of conventional education model online or that such a transfer is progressive. Technology has the potential to entirely replace time-bound and lecture-based education with asynchronous, flexible, and personalized approaches that maintain the integrity of formal education achievement in ways that are both cost-effective and scalable. This disrupted form of education relies on an ODDE operating model, based on the paradigm of asynchronous, team-based, authoritative courseware that can be studied independently by design, with optional peer engagement. Clearly there are elements of most disciplines where interpersonal interaction and practical skills may require some synchronous engagement. However, these supplement, rather than determine, the teaching model. Developing an education orientation by necessity dethrones the teaching- or supply-focus that dominates most traditional or conventional forms of education. Typically the impetus for change is felt more sharply by administrators than by faculties (Norris et al., 2013), though even those in institutional leadership

roles “continue to demonstrate a startling lack of insight into the power and promise of, in particular, online education now occurring at all educational levels” (Beaudoin, 2016, p. 11).

---

## Transforming to and Within ODDE

Despite the apparent benefits and student-centeredness of ODDE and multiple indications that transformation is both educationally desirable and strategically sensible (Christensen & Eyring, 2013; Nichols, 2020; Norris et al., 2013, 2014), why is it seldom seen? Reasons such as strong demand for the social rite of passage for full-time university study, academic resistance, lack of vision, and concern as to the quality of online digital distance education are often cited. However, it could be argued that these factors are not as apparent as they may have been. More likely is that higher education favors the incumbent through high barriers to entry (large investment, high compliance requirements, and the need for a quality academic reputation in advance); no crisis of demand (enrolments continue to increase even as tuition costs do); and an operating model built around the scarcity of academic knowledge (Nichols, 2020). Beaudoin points out the “obvious irony in the fact that although the college experience can be transformative for so many people, the learning organization is inherently resistant to transforming itself” (2016, p. 15).

Of course, a further barrier to transformation is that it is a level of change that is incredibly challenging. Leaving a conventional education operating model for an ODDE one requires attending to four major aspects of an institution: strategy, policy, systems, and challenges (Minnaar, 2013). Beneath these headings, which are the major codes from a synthesis study, lie multiple decisions that challenge the conventional assumptions around teaching and learning such that “To move from a face-to-face institution to ODL needs redefining of the institution as a whole” (Minnaar, 2013, p. 87). Further challenges relate to added requirements for policies related to the design and development of courseware and teaching roles. Legal obligations related to intellectual property, copyright, and licensing come to the fore, as do terms and conditions of employment; most critically, a move toward ODDE from conventional education challenges that most fundamental of academic concerns: what it means to teach and be a teacher. Focusing the teaching role is an important component of transforming to ODDE (Minnaar, 2013; Moore & Kearsley, 1996; Seelig, Cadwallader, & Standring, 2019), particularly because “in distance education instructors usually work closely with a number of different people in the development and delivery of the course” (Moore & Kearsley, 1996, p. 127). That this is the case may explain why faculty resistance to online education is so high (Paul, 2014).

A variety of educational roles must be established or, yes, transformed, if ODDE is to succeed. Each of the seven Canadian universities in Ives and Walsh (2021) mentioned the necessity of instructional designers in their move toward online education, whether in support of conventional education or ODDE. In work considering planning successful uptake of open and distance learning, Minnaar points out that in conventional education “individual teachers develop and deliver their own

courses. . . Educators try to be everything to everyone and to be experts in communication, curriculum design, course design, assessors, motivators, facilitators, as well as content experts,” whereas in ODDE “it is important to move to a system where teachers are the specialists within a system” (2013, p. 102). What this might resemble is illustrated in the Open Polytechnic transformation in New Zealand (Seelig et al., 2019), whereby an ODDE institution further refined its academic role to specialize on subject matter expertise, teaching, and research in the context of other roles concerned with learning design and development, assessment activities, and learning support. That the change required further refinement of the organizational operating model and new practice no longer resembles the incumbent confirms its transformational status.

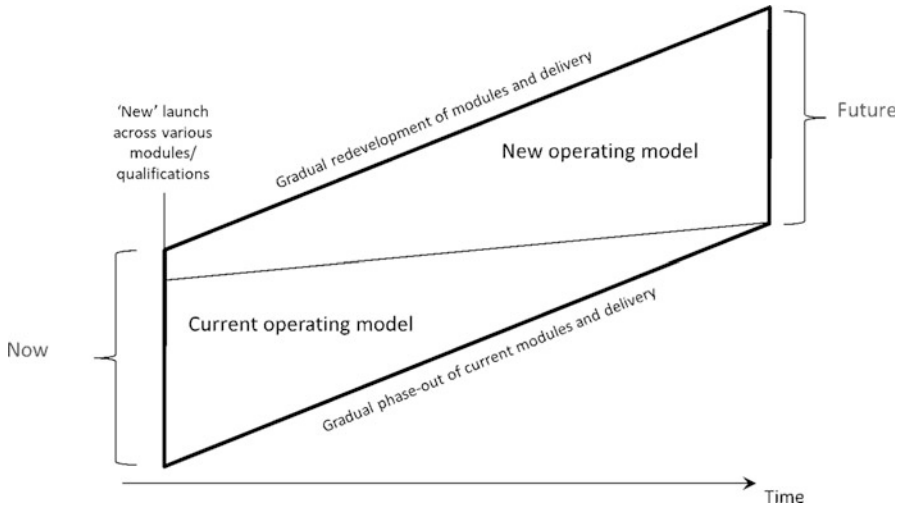

## Managing a Transformation

Vision, leadership, strategy, and change management are core themes across institutions transitioning to online education and ODDE (Ives & Walsh, 2019, 2021; Nichols, 2020), though staff development and information technology infrastructure are also essential for adding digital media to education systems (Bernhard-Skala, 2019). Ensuring adequate resourcing is also an identified aspect of success in literature (Ives & Walsh, 2021). Institutions that appear to have made a positive transition to ODDE include Western Governor’s University, Southern New Hampshire University, and New Zealand’s Open Polytechnic (Christensen & Eyring, 2013; Seelig et al., 2019), each of whom identified opportunities to improve the access, flexibility, and practice of higher education through the deliberate implementation of digital technologies and rethinking the constraints of conventional education systems.

The complexities of managing change are well documented, and an enduring set of stages is readily available for those considering it (Kotter, 1996). The strategy, policies, systems, and challenges arising from change toward ODDE require significant leadership and managerial coordination (Beaudoin, 2016; Minnaar, 2013). Challenges specific to transforming into ODDE include the likes of expensive start-up costs, developing ways of engaging with new learner groups, adopting a new form of competitiveness, new forms of marketing, and addressing different student support requirements (Minnaar, 2013). Minnaar suggests beginning with strategic planning, followed by policy development and systems design (2013).

Norris et al. (2014) suggest starting with a 5-month design phase, whereby multiple perspectives are invited to address questions related to “what is happening now?”, “what is the future in 10 years?”, and “what opportunity does this create?” In the sixth and seventh months, these ideas are refined as multiple opportunities are consolidated. In the final 5 months, a convergence of these ideas takes place in the align phase, starting with “several big ideas” and “exploring the strategies” that might be used to implement them and then finalizing the “selected strategies and actions” that bring the entire design to a conclusion.

**Fig. 1** A gradual adoption of a new operating model. (© The Open University (2017))

There are two main options for transformative change: either reinvent or reshape the core business model or “create a separate disruptive business to develop innovations that will become the source of future growth” (Norris et al., 2013, p. 12) enabling gradual adoption (Fig. 1). Each option leads to very different strategies (Norris et al., 2014), though the latter has the advantage of less risk and the opportunity to encourage further change as success is experienced (Christensen & Eyring, 2013; Minnaar, 2013). The risks of implementing a comprehensive new model of teaching and learning, enabled by a new series of operating processes, make the latter option much more viable. Beginning with tentative, malleable processes enables experience to further shape design in anticipation of more robust, scalable means of working. Regardless of the model employed, transformative change takes a committed investment of time (Minnaar, citing a Commonwealth of Learning report, suggests up to 5 years), funding (most courseware development costs are up-front), and courage.

## Conclusion

ODDE is a different paradigm of teaching and learning to that of conventional education. Conventional education providers seeking to realize ODDE benefits, then, must anticipate transformation of their operating models across the dimensions of the timing and responsibility of the education experience, role of the instructor, location of instruction, and the necessity of student peer-to-peer contact. The more fundamental elements of this change relate to the asynchronous bias of ODDE and, therefore, the role of synchronous teaching and the need for a timetable. “Going online,” then, does not automatically confer any of the traditional benefits of

accessibility, cost-effectiveness, flexibility, openness, and scalability. Without a deliberate redesign of the underlying operating model of education, “going online” results in transfer of practice rather than transformation.

“Hybrid” or “blended” models are also problematic as means of ODDE, in that these tend to betray a conventional education starting point. The underlying operating model, designed to support lectures, contact classes, and timetables, constrains the potential reach toward accessible, cost-effective, flexible, open, and scalable education. Attempting to cater for both conventional education and ODDE at the same time results in increased costs and a blurring of specialist input across the education endeavor. Ultimately the role of the instructor can be traced back to a binary of synchronously in front of a class or asynchronously represented in courseware.

A transformational shift toward ODDE makes sound strategic and educational sense, but change is challenging. Norris et al. describe transformation as requiring:

a commitment between the board and the president to push the campus community beyond its comfort zone, risking the slings and arrows of campus pushback in order to fulfill the responsibility of stewardship for the future of the institution in the Age of Disruption. (Norris et al., 2013, p. 13)

It is helpful to consider conventional education and ODDE as contrasting starting places, both with different assumptions about how education takes place. However, while conventional education is identifiable through a dedicated teacher and class timetable, ODDE is more varied. If conventional education and ODDE are considered as extremes (or paradigms), the dynamics of transformation become much clearer. Fortunately there are institutions that have successfully made the transition to ODDE, and a mature literature now exists for those seeing to achieve the same.

## Abstract

This chapter will explore professional development (PD) of academic and teaching staff in the use of technologies to support learning in mixed modalities including blended and online modalities in higher education contexts. The authors will explore current practices in both face-to-face (f2f) and online/distance education contexts. A succinct annotated review of key seminal and recent texts will be provided of current trends in relation to PD of staff and the implications that arise from this research for practitioners. Two very different but relevant examples of PD will be provided to bring the discussion to life: (i) at the Open University, UK, and (ii) at Royal Melbourne Institute of Technology, Australia.

**Introduction**

With the rise of enrolments through online education across the globe, academic professional development (PD) has never been more important to provide quality learning experiences for learners. There is no single *one-size-fits-all* model; however, there are numerous points of research that provide insight into the practices across higher education institutions which participate in distance education, online education, and all manners of blended modalities. Many universities have centers of learning and teaching which quite often have responsibility for academic PD, while other universities have a more decentralized approach, where PD support and activities are situated in individual faculties. This chapter situates PD through the lens of COVID-19, and while the literature in the field is vast, the authors have included significant and relevant research, augmented with concise case studies of PD in practice. Finally, the chapter concludes with a number of recommendations to practitioners.

---

**Context**

2020 was the beginning of a pandemic that most across international datelines could not have imagined. No part of the globe was untouched by the COVID-19 virus and its numerous variants as wave after wave ravaged even the wealthiest of countries. The impact on those most vulnerable, the old, sick, and disabled, those living in poverty and millions of children whose education just stopped will be a legacy that we will all live with for generations to come. It was a crisis unimagined.

Higher education institutions closed their doors and overnight and instantly became providers of online education – or rather what was coined as *remote education* as few were prepared for the requirements of creating an engaging and fulfilling online learning experience. Most were prepared through their digital infrastructures and enterprise learning management systems, but, unless you were already a provider of online education, the disruption was enormous. Students the world over were now in their bedrooms, kitchens, and lounge rooms, in their cars, and in the corner shop or anywhere they could access the Internet.

Teaching and research staff, again unless used to teaching purposefully designed online learning experiences, were seeking whatever PD they could get to support their practice. Staff found themselves setting up home offices, learning how to teach online, and using video technologies to engage with their students. Many were stressed and reported fatigue with being online so much and ill equipped for what was required of them.

Distance education institutions did not escape the impact of the global pandemic, despite many having the digital infrastructures, capacity, and resources already designed for online learning. Many institutions faced staff shortage due to furlough, sickness (COVID-19-related or not), or caring responsibility, which resulted in increased staff workload. The need for student support increased substantially, as many students were vulnerable, lived in shared or abusive homes, and had financial difficulties as many lost their jobs. Some assessment strategies had to be reconsidered or eliminated altogether, as students were not able to attend examinations that usually took place in the distributed distance centers.

This grim picture, however, had some silver linings especially when it came to the PD or academic development as is often coined of the academic workforce. For many years, the debate about the academic development of our academic staff within our tertiary institutions has been one which has been fraught, caught between the discipline qualifications that an academic ordinarily has at postgraduate level and the requirement to be able to teach. There is an old argument that a PhD does not give you a “license” to teach nor does it mean you can teach across a range of modalities. There is a 30 plus year research base for education including learning and teaching across numerous disciplines in higher education. A quick scan of the journals reveals many tomes which have a focus on learning and teaching.

Higher education institutions have long faced this dilemma, and all manners of opportunities for engaging with the art of teaching have been in place. Centralized learning and teaching centers have for years provided seminars, formal certificates, and diploma courses to develop the skills required to teach, underpinned by the theoretical basis for what makes a good learning experience. But, and here is the but, much of that provision is accessed by a small number of academic staff who are interested in learning and teaching, and often those who need the support the most do not engage with such opportunity for support and upskilling. Most of the research literature is made up of small case studies, too numerous to quote here, which reinforce that we still really do not know categorically whether such training has an impact on both what and how our students learn. These cases provide a peek into classrooms of our educators and are primarily “happy” stories of success.

Still, something changed during COVID. Across the globe, there were reports that universities had thousands of their staff sign up for PD. They needed to know how to teach online. Suddenly, it became urgent and necessary to reach out for support and ideas and to skill themselves in new techniques. What might have taken 5 years was done overnight. The debate of whether these staff were *really* teaching online or, as many in the online business would say “they were teaching remotely” of course exists and is completely legitimate. Online teaching requires specialized design and engagement with learnings that is distinctly different to the campus-based experience. It isn’t as simple as putting your lectures online and holding tutorials. As we learn more about online learning, the specialized knowledge and pedagogical approaches are becoming more important. Our learners demand more than simply reading a book online.

Interestingly, as countries across the globe emerge from their lockdowns and return to the campus, learning and teaching has altered and probably for good. No

doubt, in years to come, we will see research emerge which will fully analyze and report on COVID-19 impacts. Our learners are now likely to experience a mix of campus and online modes. Some of our staff are even saying they prefer being online. And many of our students are asking for the flexibility that online learning gives them. Some of them have opted to enroll themselves in established open and online universities instead. One example of this is the Open University UK, which experienced a 15% increase in the total number of students enrolled for the 2020/2021 academic year. It should be noted however that many of the institutional surveys in Australian institutions have reported significant drops in the national student engagement scores over 2020 and student feedback has been variably related to their experiences over the past 12 months.

While distance and online learning has been the territory of the distance education provider, it has, over the past few decades, been slowly changing. The rise of learning management systems, smarter digital technologies, and the Internet has seen most tertiary institutions engage in blended or online learning to some extent. Distance learning has essentially been replaced by online learning where the infrastructure can support it.

Supporting our staff to embrace technologies now appears to be a thing of the past, and the challenge is how we shift from teaching remotely to designing for online. For many familiar with this literature, this may feel like a flash back to the past. Distance education providers have been entirely familiar with these challenges since their inception a few decades ago. Regardless of where your institution is along the continuum of embracing new technologies in a variety of modes, there is much to learn from what has gone before us.

---

## Literature

From the enormous literature available, the authors have purposefully selected articles that have resonated with the authors and that have recognized standing within the field.

Angela Brew is an Australian expert in academic PD and has written many pieces in this field. She has been a strong advocate for a scholarly approach to PD. In this seminal article, Brew (2010) argues that scholarship should be at the center for both students and teachers to create an environment where research, scholarship, teaching, and learning are viewed as part of one whole. She believes that this integration is key to promote lasting and transformational improvements in learning and teaching in higher education.

However, this integration has implications for academic development. This means that developers need to work in partnership with a range of university stakeholders, including academics, senior and mid-level managers, sessional staff, students, and professional staff, to create a more inclusive, inquiry-focused higher education. This also means that developers need to take into account different contexts and perspectives, as there is no one-size-fits-all solution to the “super-complex, uncertain and ambivalent world in which we practice” (p. 114).

Discussions and cooperation are required so that a holistic and inclusive approach is developed.

The key lessons from this article are as follows:

- (a) The scholarship of academic practice can build capacity of academics.
- (b) Developers need to understand and undertake the scholarship of learning and teaching themselves.
- (c) Graduate certificates can provide opportunities for academics to engage in scholarship of learning and teaching.
- (d) Individual and institutional contexts need to be taken into consideration so that a holistic and inclusive approach is developed.

Daumiller, Rinas, Olden, and Dresel (2021) studied the learning engagement and learning gains resulting from academics undertaking PD and how their own achievement goals are related to such engagement and gains. Findings demonstrated that those who began with positive motivations and goals learned well and had high learning gains; however, substantial differences in the gains were found. The research demonstrated that for those designing and deploying PD, they should not utilize the same methods for each academic and that tailored support is more effectively related to individuals' motivations.

The key lessons from this article are as follows:

- (a) The goals academics had related to their achievement in a PD program impacted the learning gains they had.
- (b) Those high on work avoidance used minimal resources in a PD program.
- (c) Those who were concerned about appearing incompetent and lacking in knowledge achieved lower learning gains.
- (d) Understanding the motivation of academics in a PD program can lead to better strategies regarding engagement and allow for more personalized options targeting their own goals and ways of learning.

The research by Evans, Yip, Chan, Armatas, and Tse (2020) examines the data from a Hong Kong university's learning management system (LMS) to examine the effectiveness of a PD course as to how teachers' behavior in an online environment changed and how the skills they learned during the PD were applied when teaching. The research highlights the significant increase in teacher's activity in the LMS during a delivery period including the use of a larger number of tools, particularly those that encouraged and facilitated collaboration. The delivery of the PD course in a blended mode demonstrated positive effects on teacher's future practice in blended modes of teaching.

The key lessons from this article are as follows:

- (a) Delivering PD in the same mode as the proposed teaching will take place provided a more authentic experience which allowed staff to "put themselves in their students shoes."

- (b) Those who learned in a blended and online mode therefore used more tools and features of the LMS than they had previously done before the PD.

Gregory and Salmon (2013) consider the experiences of an Australian university in designing and delivering an approach to PD for online teaching that could be done at pace and was scalable and also addressed the key skills for teaching online rather than just technical ability or expertise. The researchers utilized a model of online PD delivery which was iterative across cycles within the teaching and learning context. Key principles for the success of the model included the use of a number of intervention cycles ensuring continuous improvement; addressing the institutions' environment and requirements, the commitment to ensuring leadership and mentoring as an ongoing activity; and engaging wider academic cohort participation through encouragement by their colleagues.

The key lessons from this article are as follows:

- (a) Having a committed and passionate leadership of PD is essential.
- (b) Having distributed and cascaded leadership and mentorship across the university assisted sustainability long terms.
- (c) Having academic staff be "champions" to encourage wider participation worked effectively.
- (d) Pace and scale can be achieved with the appropriate mechanisms, design, and support.

It is so interesting to go back and read Jamieson (2004) again. He talks about some of the challenges of teaching online in 2004 and the need to build the capacity of an academic workforce that had no experience of either learning or teaching online before. The challenge was even greater as the majority of academics teaching didn't have a teaching qualification nor pedagogical knowledge. An experienced teacher was just someone who taught for many years.

In this work, Jamieson looks at the design and delivery of academic development for a large cohort of teachers at one of Australia's largest universities in an online mode. This research was designed to test an experiential approach to building staff capability in online teaching. Most participants had a first-hand experience in teaching in flexible modes, and the approach was designed to build understanding of and empathy for their online student cohorts by embedding capability development into workplace practice. That is "learning" while on the job. The results were that academics were more engaged and connected to their students' expectations through this method and that it influenced positively their approach to their teaching practice in flexible environments.

As an attempt to bridge this gap in his university (Monash at the time), a Graduate Certificate in Higher Education (GCHE) was developed. In the paper, Jamieson talks about the structure of the program and the units' mode of delivery. The author run a little evaluation after the first unit was offered to participants. Responses were a mix of positive and not so positive insights into their experiences, as some academics were still reluctant to teach and/or adopt online learning.

The key lessons from this article are as follows:

- (a) Context and current capability are important when considering the best approach and design for PD.
- (b) For experienced practitioners, embedding capability building into current practice and the live teaching experiences promoted engagement.

The research by Macdonald and Poniatowska (2011) has positioned the importance of embedding PD (PD) in a way that is meaningful to ensure engagement by university staff who are a part of connected but diverse community with multiple types of roles within one institution. The design of the PD to be aligned to roles which then directed staff to learning tools was an approach that was successful with staff and provided a more curated and relevant PD learning experience. Utilizing both self-study and cohort opportunities also allowed further personalization with those in a cohort finding the value of such a community important although more opportunities to connect through a wider community of learners in different contexts/roles was desired.

The key lessons from this article are as follows:

- (a) PD was needed to cover staff from a wide variety of teaching roles.
- (b) Having a learner experience that was more personalized was important.
- (c) Learning individually was important but also the need to ensure opportunities for people to connect to others (individuals and groups) wanted and valued.

Whereas Salmon (2004) presents the five-step model for developing online instructors, the model is mostly focused on teaching using LMS/VLE and has two dimensions to it, with a combination of interaction and learning. One dimension develops the instructor's teaching skills, while the other provides the appropriate technological skills necessary to match these with the teaching skills and, hence, accomplish each step of the model. The five steps are "access and motivation, online socialisation, information giving and receiving, knowledge construction, and development" (p. 63).

The key lessons for this chapter are as follows:

- (a) Identify e-moderators' key competencies, so that training and development of these moderators can be planned.
- (b) Train e-moderators online instead of face-to-face, so that they experience what students will experience.
- (c) Use materials and software that can be reused, improved, and expanded to enable economy of scales.
- (d) Run evaluations of trainings.

van der Sluis, Burden, and Huet (2017) examine the impact of professional recognition programs, in particular the one offered by Advance HE in the UK, which uses the UK Professional Standards Framework (UKPSF) as a standard by

which teaching and professional staff can gain recognition for their teaching practice. Many universities in the UK and abroad can be accredited to offer an in-house version of such scheme. In this chapter, the authors provide a case study of one such institutional recognition scheme and discuss the impact it is having on practice and on practitioners. Their findings suggest that participation in recognition schemes increases engagement with the scholarship of learning and teaching and provides participants opportunities for staff development and reflection on practice, as a result reinforcing commitment to teaching and/or supporting learning.

The key lessons from this article are as follows:

- (a) Participation in recognition schemes increase engagement with the scholarship of learning and teaching.
- (b) The process helps practitioners to reflect on their current and future practice.
- (c) Receiving the fellowship provides participants a sense of reward and achievement.

The seminal work on academic PD by Webb (1996) explores theoretical foundations of staff development and argues that staff development is underpinned by the perspective offered by hermeneutics. This is due to the nature of staff development being about understanding, supporting, and helping others to improve their practice. He states that this perspective “places human relationships centre-stage” (p. 65). This stance has a direct impact on how staff development is planned and designed. Webb argues that such PD should be transformative, encourage critical reflection, instead of being merely practical, where teachers just learn how to use a particular tool or technique.

In addition to suggesting theoretical and philosophical stances for staff development, Webb also recommends in his book that action research was the most influential and the fastest-growing orientation toward staff development at the time. This was due to the fact that it has a focus on action and change for improvement.

The book also discusses the role of educational developers, as experts and supporting/counseling figures as they help their colleagues becoming better practitioners. Webb suggests that developers also need to be developed and have a supportive and collegial network which they can rely on, such as “critical colleagues” or “critical friends.” They may offer support in various ways, three of which may be described as restorative, normative, and developmental.

The key lessons from this book are as follows:

- (a) Staff development is underpinned by the hermeneutic theoretical perspective.
- (b) Staff development activities should be designed with this perspective in mind to encourage critical reflection and change in practice.
- (c) Action research could help practitioners and developers to achieve change and improvement.
- (d) Developers need to work closely with colleagues to help them to become better practitioners.
- (e) Developers also need to be developed.

Webb (2003) further suggests ten key points for quality teaching, including in distance education, that should be considered when developing academic staff. He believes that these points might assist in enhancing students' learning experiences. They are:

- Building relationships between staff and students
- Modeling scholarly values
- Encouraging cooperation
- Encouraging active learning
- Providing appropriate teaching through different teaching approaches to meet different learning objectives
- Providing appropriate assessment
- Providing prompt and helpful feedback
- Encouraging productive use of time
- Communicating high expectations
- Respecting diversity in the background and experience of students (p. 90)

However, before starting planning any academic development activities, there are a few elements that should be taken into consideration within the institution, such as institutional context and appropriate educational policies and strategies for learning and teaching.

The following cases demonstrate the practice and theory in action.

## The Cases

### Case 1: OU UK – *Applaud*

The first case from the Open University, UK, details an approach to staff PD that is aligned with a national scheme that recognizes teaching experiences at several levels of maturity from early career through to expert. As a scheme, it provides a framework of competencies that supports academics in reflecting on their practice and evidencing impact. As a form of PD, this is very attractive to academics as they are incentivized by certification that is benchmarked globally.

### Setting the Stage

PD has been recognized for decades as key to effective organizational change and to improving student learning and experience. This is even more the case today as the need to upskill and build capacity in online learning across the higher education sector has increased. In addition, and particularly in the UK, increasingly universities and professional accrediting bodies (e.g., in nursing) have adopted professional recognition such as the HEA Fellowship as one of the strategies to offer PD and recognition to staff in teaching and learning support roles. This is also the case for The Open University, which is the largest university and online learning provider in the UK and is internationally known for its excellence in learning and teaching.

*Applaud* is The Open University's institutional scheme for Accrediting and Promoting Professional Learning and Academic Development. In line with the OU distance learning approaches, *Applaud* is a fully online scheme and has been developed to provide PD and recognition of teaching excellence to its teaching and learning support staff. *Applaud* offers individuals the opportunity to gain external recognition as an associate fellow, fellow, or senior fellow of the Higher Education Academy. The fellowship category will depend on an applicant's role, experience, and responsibilities in teaching and supporting learning.

### Challenge

Schemes like *Applaud* are accredited by Advance HE (previously known as HEA) every 4 years. The first *Applaud*-accredited period was from 2016 and ended on August 31, 2020. During this time, the scheme supported over 543 applicants for HEA recognition. Although it has been generally successful, based on participant feedback during evaluation of the scheme, the fluid way that the scheme was running was inefficient and resource-intensive. Candidates could register for the scheme at any time of the year and change their submission deadline basically as often and for as long as they wanted, and this meant that it was unsustainable as the number of candidates applying steadily increased, but completion rates remained stable at around only 20–30% in any given year. One of the key reasons for this increase in registration numbers was a policy change in the UK requiring universities to report their number of HEA Fellowships in the Teaching Excellence Framework (TEF) (van der Sluis et al. 2017). As a result, OU faculties have more aggressively encouraged their staff to get HEA recognition by applying for *Applaud*. In addition, Fellowship of the HEA has progressively become a requirement in job advertisements and renewal of teaching contracts in the UK higher education sector.

### Solution

As the *Applaud* team prepared for the reaccreditation of the scheme in 2019, the *Applaud* team saw an opportunity to make the changes needed to create a scheme that provided better support to candidates, had stronger connections with the faculties and related units, and was less resource-intensive.

Some of the main changes adopted were the following:

- *Applaud* now uses a cohort system with 60 candidates per year accompanied by 3 workshops per cohort and a set timeframe for registration and submission of the fellowship application.
- A Triage Page was added to the *Applaud* website to guide and assist candidates to choose the right fellowship category for them. Candidates are asked to complete the Triage Page before registering.
- The development and implementation of a dedicated software that links all elements of the *Applaud* process from registration to submissions and panel decisions to cope with the increased demand and improve efficiency.

- The *Applaud* Quality Steering Group was created. It has representatives from all faculties and key units. They meet twice a year to discuss and oversee *Applaud* high-level strategies.

Two main activities supported the core changes in the scheme. One was an evaluation of the previous scheme through an online survey that was sent to over 450 participants who successfully gained their HEA Fellowship through *Applaud*, with 108 valid responses ( $n = 108$ ). Despite the challenges presented, the scheme has been somehow successful. Survey responses indicated that the scheme has had a positive impact on participants' practices (81%), as 72% of them were more confident in their role as teachers/supporters of learning and 66% felt more confidence to undertake scholarship of learning and teaching. We then presented the findings of this survey and the proposed changes in the scheme to key *Applaud* stakeholders across the University during a workshop. The event enabled key stakeholders to discuss and provide feedback on the proposed changes. This workshop was important as it acted to strengthen *Applaud* connections and get buy-in across the University.

## Results

The newly accredited *Applaud* scheme started on September 1, 2020 (accredited period 2020–2024). At the time of writing, two cohorts have completed the new scheme (approximately 98 candidates). Asking candidates to self-assess through the Triage process before registering has helped them to select the right fellowship category for their evidence of practice, and, as a result, only six candidates have needed to change categories. The move to a cohort structure has also proven to be the right strategy. The workshops provided to each cohort have been well attended (60–80% attendance), and most candidates have felt more supported. As a result, completion rates have increased to between 70% and 80% a year. More support to candidates has also meant that the quality of submissions has improved, based on the reviewers' feedback. Each candidate is supported by an individual trained mentor.

In total, *Applaud* manages over 115 mentors. Feedback from mentors has also been mostly positive. The cohort structure means that they can choose a particular time of the year that they are available to mentor *Applaud* candidates, helping them to better manage their workloads, instead of the previous ad hoc approach. The dedicated software system has taken longer than expected to be developed, but Cohort 2 submissions and panel review have taken place electronically saving time and effort and increasing accuracy in data handling. So far, the results of the changes implemented in the *Applaud* scheme have been beneficial to most stakeholders, including candidates, mentors, reviewers, and the *Applaud* team. However, an evaluation of the new scheme is being developed to fully capture participants' perceptions and experiences with the scheme. Hopefully, the reaccredited scheme will continue having a positive impact on participants' practices as the previous. Whether or not student learning outcomes have been improved will require further investigation. Ultimately, the main reason for such a program is to improve the student experience and their learning outcomes.

## Case 2: RMIT

Case 2 has a focus on the response to COVID-19 and details the quality approach taken to an end-to-end experience for students and in supporting staff in their PD journey. The imperative here was to provide PD as a “just-in-time” solution in addressing the issue that most of the staff did not have any previous expertise in online learning.

### Setting the Stage

Royal Melbourne Institute of Technology (RMIT) is a large dual-sector university in Melbourne, Australia, with a student population of approximately 93,000 based in Australia as well as in other global locations. RMIT is primarily a campus-based university operating in Melbourne, Singapore, and Vietnam. Although RMIT has a subsidiary called RMIT Online, this represents about 10% of the total student cohort.

### Challenge

In response to the COVID-19 pandemic and the students impacted by the initial wave of international travel bans, RMIT identified 300 courses across its suite of programs that could be offered via remote delivery to students in impacted countries where students were unable to travel to Australia to commence or continue their studying. With the escalation of the situation in Melbourne and the implementation of staged restrictions related to group gathering sizes and the need for physical distancing, RMIT Melbourne ceased face-to-face lectures in March 2020, and face-to-face tutorials/practicals were moved to online/remote delivery for all courses (3000 approx.). While there were some on-campus activities and assessment during 2020 when restrictions allowed, the majority of the learning took place online for the entire academic year.

### Solution

In response to the longer-term requirements, RMIT responded by ensuring standards related to online/remote learning were developed and implemented to ensure a consistent RMIT-wide approach. This was augmented with a quality management semester end-to-end and process-related, to ensure the attainment of student learning outcomes, holistic student support, and staff capability development.

Prior to 2020, RMIT did not have a large-scale expertise across its workforce in the delivery of online or remote learning, and, therefore, there needed to be a direct and clear strategy to support thousands of academics and teachers in transition to a changed mode of paced delivery. Also, the PD also had to be delivered online and have several approaches to be able to accommodate different staff capabilities and mindsets. Also, it needed to support an initial and immediate need as well as having an ongoing approach as a teaching semester progressed.

RMIT therefore utilized a multifaceted approach of:

- Initial online sessions targeting key elements of online learning centered around the RMIT online teaching guidelines designed to support staff in the pre-semester

preparatory period and in the first few weeks as they transitioned the design of their course and the mode of delivery

- An ongoing opportunity to engage with the workshops throughout the semester around key areas that may continue to be challenging to their teaching practice
- A just-in-time online live chat function to get immediate support for an individual and support discrete issues that staff might be experiencing or wanted to seek advice on

Around 40% of staff attended PD sessions; over 50% of these were during the first week of teaching with a further 16% attending in week 2, while the remainder of the semester attendance held steady between 2% and 4% of staff. A total of 153 professional capability sessions were run across a 12-week period.

24/7 live chat sessions were held with a high volume of chat in the second and third week of semester as staff progressed from the workshop sessions to more targeted support. Chat dropped in week 4 before stabilizing for the rest of the period. Technical support for tools and the University Learning Management System (LMS) was where most support was most sought.

## Results

In order to determine impact and the success of the approach, staff satisfaction data were collated resulting in a 95% satisfaction rating, as well as the validation of the success of the implementation of the online learning guidelines which the PD supported. This had mixed results, with some key areas such as the design and delivery of assessment in an online environment challenging academics and teachers which was unsurprising due to the large practical nature of RMIT's curriculum and the teaching of vocational educational competencies. Elements of improvement were also identified as required in the provision and type of learning resources. Further data related to student engagement with the learning management system (LMS) was also used to further clarify the outcomes and the potential future strategy of online/blended learning and the PD support that would underpin such a strategy.

The immediate necessity of such PD and the significant staff engagement with these opportunities demonstrated that the approach taken, by providing both depth and breadth in support, as well as scheduled and just-in-time PD was appropriate in the circumstances that presented themselves.

The learnings from this period have significantly changed the environment of RMIT with an appetite and a subsequent strategy to continue the digital uplift of programs and courses utilizing the best of both a physical and digital environment to inspire and deliver flexible and meaningful learning experiences and successful student outcomes. With an enterprise-wide focus, this has also meant the professional learning capabilities and opportunities have been strengthened with a modularized set of blended learning sessions developed that are self-paced, adaptable, and aligned to the pedagogical approach being embedded into curricula, thus creating a more holistic professional learning framework to support future aspirations and strategic directions.

## Conclusion

At this point in the chapter comes the difficulty of drawing out key themes and recommendations for the reader. What can we learn, for example, from the intersection of the theory in the annotated readings and the practice found in the cases? Lessons learned for each article are provided for rich reading.

There is no doubt that there is a complexity when it comes to supporting academic staff in their ongoing PD as teachers and pedagogues.

No discussion about staff development is separated from the topic of quality. Waring (2019) goes as far to say that “staff development is a prerequisite for quality” (p. 363). In Australia, the Tertiary Education Quality and Standards Agency (TEQSA) has an expectation that academic staff both are qualified and have currency to fulfill their role as educators and researchers. We note the Quality Code for Higher Education, UK, echoes similarly. No doubt this requirement can be found among quality codes the globe over. As the responsibilities of staff shift in complex higher education environments because of both external and internal drivers, staff capabilities also change to meet new demands. And it was evident during COVID-19 as many universities moved into remote and online teaching that new skills were required. For the learning outcomes of our student cohorts to not be affected negatively, academic staff needed to upskill and develop a deeper appreciation for the pedagogies of online learning quickly.
